drop-press (dro'p-pres), *n.* A swaging, stamping, or forging-machine having either a regular or an intermittent motion. It is essentially a power-hammer moving between vertical guides, and delivering a dead stroke blow either from its own weight or by weight combined with power. In simple machines the weight is raised above the anvil by hand by means of a cord, and let fall, but as the same machines are wasteful of labor they have been entirely superseded by power machines in which the weight is raised by a strap wound over a drum, or by a wooden slit pressed between two pulleys revolving in opposite directions, or by direct connection with a wrist on a disk wheel. The weight is either released at any point of its path by some simple device controlled by a lever within reach of the operator's hand or foot, or it descends by the movement of the disk. If a spring is interposed between the weight and the lifting apparatus, whatever its form, to absorb the recoil, it is called a *dead stroke hammer* or *press*. In the drop-press, employing a strap or other lifting device that is released at the will of the operator, the blows are intermittent. Where the connection with a wheel is direct, the blows are regular and uniform so long as the machine works. All things shaped from hot metals on a drop-press, such as small parts of machinery, are called *drop-pressed*. The drop-press is sometimes called simply *press*, and sometimes *drop-hammer*. It should not be confounded with the stamping press, which, while it is allied to the drop-press, differs essentially in its manner of working.

The most simple form, also known as the *galathea shutter*, and the one that gives a name to all other appliances of the kind, consists of two opaque pieces, each pierced with a hole, and arranged to slide one over the other. One of the pieces is fitted over the lens-tube, and when the openings in the two pieces are in line, the shutter admits light to the camera. When it is desired to make a very short exposure, the movable slide is raised till the opening of the tube is closed. On letting the slide fall, the opening in it passes before that in the fixed piece, and for an instant light is admitted to the plate behind the lens. To accelerate the fall of the slide, various devices are used, as springs or elastic bands. Improved drop shutters have the form of revolving disks actuated by springs, etc., or that of flap-shutters controlled by a pneumatic device, etc.; and in many the opening is made to take place eccentrically, or the holes in the shutters are cut of various shapes, with the object of distributing the light, and giving a greater volume of light to the foreground or the lower portion of the picture, which is naturally not so well lighted as the higher portions.

The true drupe consists of a single one-celled and usually one-seeded carpel, but the term is applied to similar fruits resulting from a compound pistil, in which there may be several separate or separable putamens. Many small drupes, like the huckleberry, are in ordinary usage classed with berries. On the other hand, some drupe-like fruits, as that of the hawthorn, are technically referred to the pome, and the coconut and walnut, being intermediate between a nut and a drupe, are described as drupaceous nuts.

Various processes for preparing dry plates have been experimented with almost since the earliest diffusion of photography, but most of these processes afforded plates of very uncertain quality, slow in operation, and exceedingly unreliable in their property of keeping. Dry plates have comparatively recently come into general use in great measure superseding the old wet plates, owing to the adoption of gelatin as a medium for the sensitive agent (bromide of silver), which is formed into an emulsion with the gelatin, and spread in a thin film upon some support, as glass, paper, or metal. Such plates require a remarkably short exposure to make a picture are very convenient to handle, since the operator can make a number of exposures at one time and place, and can perform the chemical operations of development, etc., at his convenience, weeks afterward, if necessary, at any other place, instead of being forced, as with wet plates, to finish his picture at once. Moreover, the gelatin film is so tough that it is hardly necessary to varnish a dry plate picture, as is indispensable with the tender collodion film, and these plates can be prepared commercially at small cost and of even quality. Their chief defect is that they cannot, as now made, be trusted to keep unimpaired in warm, damp weather, while unexposed or undeveloped, unless carefully protected from the air (in airtight boxes).

In the Mazdean or Zoroastrian religion we have the best example of a dualistic faith. Faiths of the World, p. 350.

So *diver*, *dipper*, *dopper*, etc., names applied to diving birds.] 1. A lamellirostral natatorial bird of the family *Anatidae* and subfamily *Anatinae* or *Fuligulinae* (which see). The technical distinction between any duck and other birds of the same family, as geese and mergansers, is not clear; but a duck may usually be recognized by the broad and flat bill, short legs, scutellate tail, and entirely feathered head. The common wild duck or mallard is *Anas boschas*, the feral stock of the domestic duck. The species of ducks are numerous, about 125, divided into some 40 modern genera, and found in nearly all parts of the world. Most ducks fall in one or the other of two series, fresh-water ducks or river ducks, *Anatinae*, and salt-water ducks or sea-ducks, *Fuligulinae*; and from the latter a few are sometimes detached to form a third subfamily, *Eristasturinae*, but the implied distinction in habits by no means holds good, since some or any river-ducks may be found in salt water, and few if any sea-ducks are entirely maritime. The mallard and closely related species now form the restricted genus *Anas*. Teal are small ducks, chiefly of the genus *Querquedula*; *Q. ciria* is the garganey. The widgeons form the genus *Mareca*; the gadwalls *Gallinula*, the spoonbills, *Spatula*, the pintails or sprigtail, *Dendrocygna*. Certain arboreal ducks of various parts of the world constitute the genus *Dendrocygna*. The muscovy duck or musk-duck is *Cairina moschata*. The celebrated mandarin-duck of China and the wood-duck or summer duck of the United States are two species of the genus *Aix*. *A. galericulata* and *A. sponsa* sheldrakes or burrow-ducks are of the genus *Casarca* or *Tadorna*. A number of sea-ducks with black or red heads are placed in genera variously named *Fulonia*, *Fulix*, *Arthya*, *Nyroca*, etc.: such are the scaups and pochards, the canvasbacks, and others. The buffleheads, goldeneyes, and whistlings belong to a ge-

century, by the Norman duke Roger II. In 1283 a gold ducat was struck in Venice, but the piece was afterward called a *zechini* (sequin), the ducat becoming only a money of account. (See *det* 2.) The earliest gold coins of Germany seem to have been called *ducats*, and this name was applied to German gold coins of the sixteenth and seventeenth centuries. Gold coins called *ducats* were also issued in the Netherlands, in Hungary, and elsewhere. The value of the ducat varied but little, the coin usually containing from 3.42 to 3.44 grams of fine gold worth from \$2.27 to \$2.32.

Eiders are large sea-ducks of the genus *Somateria* and some related genera. Scoters and surf-ducks, also called sea-coots, are large black sea-ducks of the genus *Pelecanus* and its subdivisions. merely one of the spontaneous products of popular slang. There is no known way, even in slang etymology, of "deriving" the term, in the sense used, from *duds* (formerly sometimes spelled *dudes*: see *dud*), clothes, in the sense of "fine clothes"; and the connection, though apparently natural, is highly improbable.] A fop or exquisite, characterized by affected refinements of dress, speech, manners, and gait, and a serious mien; hence, by an easy extension, and with less of contempt, a man given to excessive refinement of fashion in dress.

A single combat; specifically, a premeditated and prearranged combat between two persons with deadly weapons, and usually in the presence of at least two witnesses, called *seconds*, for the purpose of deciding a quarrel, avenging an insult, or clearing the honor of one of the combatants, or of some third party whose cause he champions. The origin of the modern practice of dueling was doubtless the judicial combat or wager of battle resorted to in the middle ages as a means of settling disputes. The practice was formerly common, but has generally been suppressed by adverse public opinion in civilized countries. In England and the United States dueling is illegal, death resulting from this cause being regarded as murder, no matter how fair the combat may have been; and the seconds are liable to severe punishment as accessories. *Deliberate dueling* is where both parties meet avowedly with intent to murder. In law the offense of dueling consists in the invitation to fight, and the crime is complete on the delivery of a challenge.

2. In Great Britain, France, Italy, Spain, and Portugal, a hereditary title of nobility, ranking next below that of *prince*, but in some instances a sovereign title, as in those of the dukes of Burgundy, Normandy, Lorraine, etc. (see 3, below), or borne as his distinguishing title by a prince of the blood royal. The first English duke was Edward the Black Prince, created Duke of Cornwall in 1337. Dukes, when British peers, sit in the House of Lords by right of birth; Scotch and Irish dukes have a right of election to it, in common with other peers of those countries, in certain proportions, in other countries, except Germany (see below), the title conveys no prescriptive political power. In Great Britain a duke's coronet consists of a richly chased gold circlet having on its upper edge eight strawberry leaves, with or without a cap of crimson velvet, closed at the top with a gold tassel, lined with sarcenet, and turned up with ermine.

In the middle ages, on the continent of Europe, all dukes were hereditary territorial rulers, generally in subordination to a king or an emperor, though often independent; now only German dukes retain that status and of these there are but five, those of Anhalt, Brunswick, Saxe-Altenburg, Saxe-Coburg-Gotha and Saxe-Weimagen. Modena and Parma, in Italy, were ruled by sovereign dukes until their incorporation with the kingdom of Italy in 1860.

They have no stated places of worship, observe no holy days, reject the use of images and all rites and ceremonies, have no ordained clergy, and do not acknowledge the divinity of Christ or the authority of the Scriptures, to which they give, in so far as they accept them, a mystical interpretation. Owing to their numbers and cruelties, they were removed to the Caucasus in 1841 and subsequent years, they now form a community there of seven villages.

dulcarnont, *n.* A word occurring in the phrase *to be at dulcarnon* — that is, to be at a loss, to be uncertain what course to take. It is found in the following passage from Chaucer:

"I am til God me be betere mynde sende,
 At *dulcarnon* right at my wylle ende,
 Quod Pandur, "V. yowre wylle here!"
Dulcarnon called þe "þe myne of wechþe";
 If smeth hard, for wechþe wol nought here,
 For veray slouth, or other wylde here."
Trouvise, iii. 931.

Dulcarnon represents the Arabic *dhu'l-karnayn* 'lord of the two horns' — a name applied to Alexander, either because he boasted himself the son of Jupiter Ammon, and therefore had in connection with him images, or, as some say because he had in his power the eastern and western world, signified in the two horns. (Selden's Preface to Drayton's Polyolbion.) But the epithet was also applied to the 17th proposition of Euclid, in which the squares of the two sides of the right-angled triangle stand out something like two horns. This proposition was confounded by Chaucer with the 5th proposition, the

famous *poms asinorum*. This, for some reason, was in the middle ages termed *Elefuga*, which is explained as meaning 'flight of the miserable,' or, as Chaucer renders it, 'flying of wretches.' *Ele* was supposed to be derived from *elepi*, meaning miserable, and this latter was itself derived from *elema*, meaning sorrow. The passage from Chaucer was first thus explained in the *London Athenæum*, Sept. 23, 1871, p. 333.

A musical instrument consisting of a body shaped like a trapezium, over which are stretched a number of metallic strings, having a compass—sometimes diatonic, sometimes chromatic—of from 2 to 3 octaves. The tones are produced by striking the strings with hammers, the heads of which have both hard and soft sides, so that different qualities and degrees of force are possible. The dulcimer is a very ancient instrument. It is specially notable because it was the prototype of the pianoforte, which is essentially a keyed dulcimer—that is, a dulcimer whose hammers are operated by keys or levers. The immediate precursor of the pianoforte, however, the harpsichord, was a keyed psaltery. See *harpsichord*, *psaltery*, *pianoforte*.

Lastly, *hyperdulia*, which is only

a subdivision of *dulia*, is that higher veneration which we give to the Blessed Virgin as the most exalted of mere creatures, though, of course, infinitely inferior to God, and incomparably inferior to Christ in his human nature.

[Formerly also *die*; < ME. *dyen*, *dien*, *doyen*, < AS. *deagian*, *dēgian*, dye, color, < *deag*, *deah*, a dye, color, < **deagan*, a strong verb found only once, in pret. *deog*, dye, tinge, prob. (like *tinge*, < L. *tingere*), orig. wet, moisten, and allied to AS. *dedu*, E. *dew*, and so to E. *day*, dew, and *dog*, moisten, sprinkle: see *dew*.] 1. To fix a color or colors in the substance of by immersion in a properly prepared bath; impregnate with coloring matter held in solution. The matters used for dyeing are obtained from vegetables, animals, and minerals; and the subjects to which they are applied are porous materials in general, but especially wool, cotton, silk, linen, hair, skins, feathers, ivory, wood, and marble. The great diversity of tint obtained in dyeing is the result of the combination of two or more simple coloring substances with one another or with certain chemical reagents. To render the colors permanent, the subsequent application of a mordant, or the precipitation of the coloring matter by the direct use of a mordant, is usually required; but when aniline and some other artificial dyes are used, no mordant is necessary. The superficial application of pigments to tissues by means of adhesive vehicles such as oil and albumen, as in painting or in some kinds of calico-printing, does not constitute dyeing, because the coloring bodies so applied do not penetrate the fiber, and are not intimately incorporated with it. 2. To overspread with color, as by effusion; tinge or stain in general.

It consists of a paper ribbon arranged to pass under a series of recording pens, and moved by means of gearing from one of the axles of the car in which it is placed. The mechanical recording appliances give the tension on the draw-bar, showing the resistance of the car, its speed, the distance traveled absolutely, and in a given number of seconds, minutes, and hours. The oscillations of the car, also the level of the rails, the alignment, the condition of the joints of the rails, and the elevations of the rails at curves, are all mechanically traced on the paper band. Besides this, by simple electrical connections, the amount of water and coal consumed in the engine, the pressure of the steam, the mile-posts, stations, etc., are recorded from the car or from the engine, and all these records appear side by side upon the paper. See *seismograph*.

1. The mathematical theory of force; also (until recently the common acceptance), the theory of forces in motion; the science of deducing from given circumstances (masses, positions, velocities, forces, and constraints) the motions of a system of particles.

The science of motion is divided into two parts: the accurate description of motion, and the investigation of the circumstances under which particular motions take place.

That part of the science which tells us about the circumstances under which particular motions take place is called *dynamics*. . . . *Dynamics* are again divided into two branches: the study of those circumstances under which it is possible for a body to remain at rest is called *statics*, and the study of the circumstances of actual motion is called *kinetics*. *W. K. Clifford*. [What is here called *kinetics* has until recently been called *dynamics*.]

The hope of science at the present day is to express all phenomena in symbols of *Dynamics*.

2. The moving moral or physical forces of any kind, or the laws which relate to them.

Mill, Logic*, VI. x. § 5.

The object of the mixture is to diminish the sensitiveness of nitroglycerin to slight shock, and so to facilitate its carriage without impairing its explosive quality. The disruptive force of dynamite is estimated at about eight times that of gunpowder. Dynamite may be ignited with a match, and will burn quietly with a bright flame without any explosion. Large quantities have been known to fall 30 feet on a hard surface without explosion. It explodes with certainty when ignited by a percussion fuse containing fulminating mercury.

dynamometer (di-nam'ō-mō'tēr), *n.* [*Contr. dynameter*, *q. v.*; < Gr. *δῦναμις*, power (see *dynam*), + *μετρον*, a measure.] An apparatus for measuring the amount of force expended by men, animals, or motors in moving a load, operating machines, towing vessels, etc.; a power-measurer. Dynamometers use the resistance of springs, weights, and friction as a test, each comparison being made with a known weight or force that will overcome the resistance of the spring, raise the weight, or balance the friction. One of the simplest forms is a steel-yard in which the force to be measured is applied to the

Balance-dynamometer (elevation).

shorter arm while a weight is balanced on the longer graduated arm. The most common form of spring-dynamometer consists of an elliptical spring that may be compressed or pulled apart in the direction of its longer axis, with an index and scale, and sometimes a recording pencil, to indicate the amount of force exerted. In the apparatus depending on friction a brake is applied to the face of a pulley, and the force is measured by the resistance of the brake to the motion of the pulley. In other forms fast and loose pulleys are placed side by side and connected by weighted levers, a certain amount of force being required to lift the lever and communicate motion to both pulleys. In still other forms coiled springs are used to test a direct strain, as in moving a load or in towing. There are other forms used to test the recoil of guns and the explosive force of gunpowder. In the Batchelder dynamometer two pairs of bevel-wheels are

Balance-dynamometer (plan)

interposed between the receiving and the transmitting pulleys, one pair in line with the pulleys, the other pair at right angles to them and in line with a balanced scale-beam. The force and resistance transmitted through the gears tend to turn the scale-beam about the line of the pulley-shafts, and this must be resisted by a weight upon the scale beam, which is the measure of the force transmitted. The dynamometer is not a direct indicator of power exerted or of work performed; but when the velocity with which resistance is overcome or force transmitted has been determined by other means, this velocity, and the measure of the force obtained by the dynamometer, are the data for computing the power or work. See *balance-dynamometer*, *crusher-gauge*, *piezometer*, and *pressure-gauge*.—**Dynamometer coupling**, a device inserted in a shaft by means of which the power transmitted may be measured.

It is to Manetho that we are indebted for that classification called by the Greeks *Dynasties*, a word applied generally to those sets of kings which belonged to one family, or who were derived from one original stock. These *Dynasties* were named as well as numbered, and their names were derived from the town, or region, whence the founder came or where he lived.

The term is applied with a certain freedom to all forms of gastric derangement, whether involving impaired power of digestion or not. But it is usually discarded when some more definite diagnosis can be made, as gastric cancer, gastric ulcer, gastritis, gastroenteritis, or when it depends on poisonous ingesta or appears as a feature of some other disease, especially if that is acute.

Functional dyspepsia, also called *atonic* and *nervous dyspepsia*, is gastric derangement, not exclusively neuralgic,

which may involve a diminished or an excessive secretion of the gastric juice, or diminished or excessive acidity in that secretion, or an irritability of the stomach-walls or an impairment of their motor functions, and which appears to depend on some defect in the innervation of the stomach, and not on some grosser lesion.

Carlyle, Sartor Resartus, p. 83.

Swainburne, Shakespeare, p. 62.

The idea is that many useless or even hurtful parts may be present in an organism in obedience to the law of heredity simply, and that such are evidences of the lack of design or purpose or "final cause" which the doctrine of teleology presumes.

The Doctrine of Purposelessness, or *Dysteleology*.

Haeckel, *Evol. of Man* (trans.), I. 100.

It is no wonder that Mr. Romanes should avow his "total inability to understand why the phenomena of instinct should be more fatal to the doctrine of *Dysteleology* than any other of the phenomena of nature."

The *Dytiscidae* are related to the ground-beetles or *Carabidae*, but differ in the form of the metasternum, and in the structure of the legs, which are natatorial. They are water-beetles, mostly of large size, with narrowly oval depressed bodies and oar-like hind legs, found almost everywhere in fresh water.

Dytiscus, Dyticus (dī-tis'kus, dit'i-kus), *n.* [NL., orig. and commonly *Dytiscus* (Linnaeus), *Dyticus* (Geoffroy, 1764), *< Gr. δυτικός, able to dive, < δύνν, a diver, < δύνν, dive, sink, get into, enter.*] The typical genus of predaceous water-beetles of the family *Dytiscidae*, having the metasternal spiracles covered by the elytra, the front tarsi five-jointed, and patellate in the male, and the hind tarsi not ciliate, with the claws equal. The numerous species are large, but difficult to distinguish. They are dark olive-green above,

It is intermediate in appearance and character between the horse and the ass (hence the specific name *hemionus*, half-ass). The males especially are fine animals, standing as high as 14 hands. It lives

Dziggetai (*Equus hemionus*).

in small herds, and is an inhabitant of the sandy steppes of central Asia, 10,000 feet above sea-level. The dziggetai or hemione is one of several closely related species, or more probably varieties, of large wild Asiatic asses which appear to lack the black stripe across the withers. Two of these are sometimes distinguished under the names of *kulan* (*Equus onager*), a wide-ranging form, and *kiang* (*E. kiang*), of Tibet. See *onager*, *ghur*, and *khur*. Also spelled *dziggetai* and in other ways.

active scheme of forms (like that given for the preceding letters) is as follows:

1. The fifth letter and second vowel in our alphabet. It has the same place in the order of the alphabet as the corresponding sign or character in the older alphabets, Latin and Greek and Phœnician, from which ours is derived (see A); but the value originally attached to the sign has undergone much modification. The comparative scheme of forms (like that given for the preceding letters) is as follows:

From the capital E have come by gradual modification and variation (as in the case of the other letters) all the other printed and written forms. The value of the sign in the Semitic alphabets was and still is that of an aspiration, a peculiar smooth *h*. But when the alphabet was adapted to Greek use, this unnecessary aspirate-sign was utilized as a sign for a vowel-sound, either short or long, being nearly that instanced in our two words *met* and *they*. This double value in point of quantity it had in all early Greek use, and until in one section of the Greek race—and later, after their example, in all the others—it was found convenient to distinguish the long sound by a separate sign, *H* (see *H*), after which the *E* was restricted to denoting the short sound, as in our *met*. This distinction was not introduced into the Italian alphabets; hence the same sign stands for both short and long sound in Latin, and with us. The name of the sign in Phœnician was *he* (of doubtful meaning; usually explained as 'window'); in Greek it was *ei*, and later *ε* *εἶ*, 'simple *e*'. It is believed, in antithesis to the double *α*, which then had the same sound. In most of the languages of Europe the sign has retained its original Greek and Latin value; in the English it has done this only so far as concerns the short sound; the long sound has, in the history of the changes of pronunciation, so generally passed over into what was originally the long *i*-sound, that we now call this sound long *e* (as in *meet*, *metre*, *meat*, etc.). The proper *e*-sound (in *met*, *they*) is phonetically a medium between the completely open *a* of *father* and the close sound *i* of *pique*. In its two quantities (*met*, *they*) it constitutes about five per cent. of English utterance. Taking into account also the numerous digraphs, as *ea*, *ee*, *ei*, *ey*, *ae*, *ie*, *oe*, in which it is found, and its frequent occurrence as a silent letter, *e* is the most used of our alphabetic signs. This frequency is due in considerable measure to the general reduction of the vowels of endings to *e* that constitutes a conspicuous part of the change from Anglo-Saxon to English. The total loss then, further, of many of these endings in utterance has left numerous cases of silent final *e*, to which others have been added by analogy with these. A degree of value in the economy of our written speech belongs to it, in so far as its occurrence after a single consonant now almost regularly indicates the long sound of the vowel preceding that consonant, as in *mate*, *mete*, *mite*, *note*, *neute*; but in many cases it appears also after a single consonant preceded by a short vowel, and such cases, as *give*, *live*, *have*, *vineyard*, constitute one of the classes where reform in orthography is most easily made, and has most to recommend it. (See *e*.) *E* has further come to be used as an orthographic auxiliary, in some cases after *e* and *a*, where it is conventionally regarded as preserving the so-called "soft" sound of those letters, as in *peaceable*, *manageable*.

2. As a numeral, 250. *Du Cange*.—3. As a symbol: (a) In the calendar, the fifth of the dominical letters. (b) In logic, the sign of the universal negative proposition. See *A*, 2 (b). (2) [*L. c.*] The base of the Napierian system of logarithms; also, the eccentricity of a conic.—4. In music: (a) The key-note of the major key of four sharps, having the signature (1), or of the minor key of one sharp, having the signature (2); also, the final

of the Phrygian mode in medieval music. (b) In the fixed system of solmization, the third tone of the scale, called *mi*: hence so named by French musicians. (c) On the keyboard of the pianoforte, the white key to the right of every group of two black keys. (d) The tone given by such a key, or a tone in unison with such a tone. (e) The degree of a staff assigned to such a key or tone; with the treble clef, the

lower line and upper space (3). (f) A note on such a degree, indicating such a key or tone (4).—5. As an abbreviation: (a) East: as, *E*. by *S*, east by south. See *S. E.*, *E. S. E.*, etc. (b) In various phrase-abbreviations. See *c. g.*, *i. c.*, *E.* and *O. E.*, etc.—*E dur*, the key of *E* major. *E moll*, the key of *E* minor.

6-1. A prefix of Anglo-Saxon origin, one of the forms of the original prefix *ge-*. It remains unfelt in *enough*. See *i*.

6-2. [*L. ē, e*, reduced form of *ex-*; see *ex-*] A prefix of Latin origin, a reduced form of *ex-*, alternating with *ex-* before consonants, as in *crude*, *clude*, *emit*, etc. See *ex-*. In some scientific terms it denotes negation or privation, like Greek *a* privative (being then conventionally called *e* privative) as, *ecandate*, tailless, anurous, *ecubitate*, toothless, etc. In *elope* the prefix is an accommodated form of Dutch *ont-*.

6-3. [*ME. -e, -en*, < *AS. -a, -e, -o, -u, -an, -en*, etc.] The unpronounced termination of many English words. Silent final *e* is of various origin, being the common representative (pronounced in earlier English) of almost all the Anglo-Saxon, Old French, Latin, etc., inflection-endings. In nouns and adjectives of native origin it may be regarded as representing the original vowel-ending of the nominative (as in *ale*, *tale*, *stake*, *rake*, etc.), or, more generally, the original oblique cases (dative, etc.), which from their greater frequency became in Middle English the accepted form of the nominative also, as in *lude*, *pole*, *mile*, *vile*, etc.; similarly, in words of Latin and other origin, as *rule*, *rule*, *spike*, *sprite*, etc. In verbs of native origin *-e* represents the original infinitive (*AS. -an*, *ME. -en, -e*) mixed with the present indicative, etc., as in *make*, *wake*, *write*, etc. In a great number of words the *e* has disappeared as an actual sound, the letter being retained, as a result of phonetic and orthographic accident, as a conventional sign of "length" an accented vowel followed by a single consonant before final silent *e* being regularly "long," as in *rate*, *write*, *rule*, *tube*, etc., words distinguished thus from forms with a "short" vowel, *rat*, *arit*, *rut*, *tub*, etc. In words of recent introduction *-e* is used whenever this distinction is to be made. In some cases the vowel preceding *-e* is short, as in *live*, *fire*, *hade*, *have*, *avenue*, *vineyard*, etc., especially in polysyllables in *-ile*, *-ine*, *-ite*, etc., as *hostile*, *glycerine*, *opposite*, etc.; but some of these words were formerly or are now often spelled without the superfluous *e*, as *bad*, *glycerin*, *hbrin*, *de quat*, etc. Etymologically, final *e* in modern English has no weight or value, it being a mere chance whether it represents an original vowel or syllable.

6-4. [*F. -é, fem. -ée*, pp. suffix, < *L. -ātus, -āta*; see *ate*.] A French suffix, the termination of perfect participles, and of adjectives and nouns thence derived, some of which are used, though consciously as French words, in English, as *protégé*, *négligé*, *retrogressé*, *déguagé*, *écarté*, etc. The Anglicized form is *-ee* (which see).

6a. A common English digraph, introduced about the beginning of the sixteenth century, having then the sound of *a*, and serving to distinguish *e* or *ee* with that sound from *e* or *ee* with the sound of *ē*. The original sound *a* remained in most of the words having *ea* until the eighteenth century, and still prevails in *break*, *great*, *yea*, and in a dialectal ("Irish") pronunciation of *beast*, *pleasure*, *mean*, etc. (which in dialect-writing are spelled so as to represent this pronunciation: see *bast*). It has become *e* in *bread*, *dead*, *head*, *meadow*, *wealth*, *leather*, *weather*, etc., and modified by the following *r*, in *beard*, *beard*, *heart*, *heart*, *earth*, *learn*, etc. In most words, however, the digraph *ea* now agrees in sound with *e*, namely, *e*, as in *read*, pronounced the same as *reed* (but the prefix *re-* like *red*). The modern digraph *ea* has no connection with the Anglo-Saxon and early Middle English diphthong or "breaking" *ed*, *ea*, though it happens to replace it in some words, as in *bread* (Anglo-Saxon *brædd*), *lead* (Anglo-Saxon *lædd*), *cart* (Anglo-Saxon *cirtre*).

6a. An abbreviation of *each*. *each* (*ech*), *a*, and *pron.* [*<* (1) *ME. ech, eche, acche, iche, yche, ueche*, etc., these being proper oblique forms, assimilated, of the proper nom. *ele, wile, etc.*, *ile, ilk, yle, ale* (> *Se. ilk, ilka*), *each*, < *AS. ale* (= *MD. ichehelic*, *elick, elck*, *D. elk* = *OFries. elik, elik*, *ek, ik* = *MLG. =Syn. 2. Earnestness, Avidity, Eagerness, Zeal, Enthusiasm, ardor, vehemence, impetuosity, heartiness, longing, impatience. The first five words may all denote strong and worthy movements of feeling and purpose toward a desired object. In this field *eagerness* has either a physical or a moral application; with *avidity* the physical application is primary; *earnestness*, *zeal*, and *enthusiasm* have only the moral sense. *Avidity* represents a desire for food, primarily physical, figuratively mental: as, to read a new novel with *avidity*; it rarely goes beyond that degree of extension. *Eagerness* emphasizes an intense desire, generally for specific things, although it may stand also as a trait of character; it tends to produce corresponding keenness in the pursuit of its object. *Earnestness* denotes a more sober feeling, proceeding from reason, conviction of duty, or the less violent emotions, but likely to prove stronger and more permanent than any of the others. The word has at times a special reference to effort; it implies solidity, sincerity, energy, and conviction of the laudableness of the object sought; it is contrasted with *eagerness* in that it affects the whole character. *Zeal* is by derivation a bubbling up with heat; it is naturally, therefore, an active quality, passionate and yet generally sustained, an abiding ardor or fervent devotion in any unselfish cause. *Enthusiasm* is so far redeemed from its early suggestion of extravagance that it denotes presumably a trait of character more general than *eagerness* or *zeal*, more lively than *earnestness*, a lofty quickness of feeling and purpose in the pursuit of laudable things under the guidance of reason and conscience; thus it differs from *zeal*, which still generally implies a poorly balanced judgment.

The nobles in great *earnestness* are going
All to the senate-house.
Shak., Cor., IV. 6.

I lent her some modern works: all these she read with *avidity*.
Charlotte Brontë, The Professor, xviii.

So Gawain, looking at the villainy done,

Tennyson, Pelleas and Ettarre.

It was the sense that the cause of education was the cause of religion itself that inspired Alfred and Dunstan alike with their *zeal* for teaching.
J. R. Green, Conq. of Eng., p. 325.

Truth is never to be expected from authors whose understandings are warped with *enthusiasm*; for they judge all actions, and their causes, by their own perverse principles, and a crooked line can never be the measure of a straight one.
Dryden, Ded. of Plutarch's Lives.

There is a certain *enthusiasm* in liberty, that makes human nature rise above itself in acts of bravery and heroism.
A. Hamilton, Works, II. 116.

eagle (*ē'gāl*), *n.* [Early mod. E. also *egle*; < ME. *egle*, < OF. *egle*, *agle*, F. *aigle* = Pr. *aigla* = Sp. *águila* = Pg. *águila* = It. *aquila*, < L. *aquila*, an eagle (prob. so called from its dark-brown color), fem. of *aquilus*, dark-colored, brown (cf. Lith. *aklas*, blind): see *Aquila*, *aquiline*, etc. The native E. name is *earn*: see *earn*³.] 1. Properly, a very large diurnal rapacious bird of the family *Falconidae* and genus *Aquila* (which see), having the feet feathered to the toes, and no tooth to the bill, which is straight for the length of the cere. There are about 9 species, all confined to the old world except the golden eagle, *Aquila chrysaetos*,

which ranges also in North America. This is the type-species, to which the term originally attached; it is 3 feet or more in length,

Golden Eagle (*Aquila chrysaetos*).

of a dark-brown color, deriving the epithet *golden* from the ruddy-brown feathers of the back of the neck. It preys on lambs, hares, rabbits, various birds, such as grouse, and carrion. Other notable species are the imperial eagle, *A. heliaca*; the Russian eagle, *A. mongolica*; the spotted eagle, *A. maculata* (or *nevia*). From its size, strength, rapacity, and powers of flight and vision, the eagle has been called the king of birds; but its prowess is greatly exaggerated. By the ancients it was called the bird of Jove, and it was borne on the Roman standards. Many nations, as France under the Bonapartes, Austria, Prussia, and Russia, have adopted it as the national emblem. In heraldry it ranks as one of the most noble bearings in coat-armour.

There myghte men the ryal *egle* fynde,
That with his sharpe lok persith the sunne;
And other *eglis* of a lowere kynde,
Of whiche that clerkis wol devyse cunne.
Chaucer, Parliament of Fowls, I. 330.

So the struck *eagle*, stretched upon the plain,
No more through rolling clouds to soar again,
View'd his own feather on the fatal dart,
And wing'd the shaft that quiver'd in his heart.
Byron, English Bards and Scotch Reviewers, I. 826.

2. A member of the genus *Haliaeetus*, which comprises the fishing-eagles, sea-eagles, or earns, resembling the eagle proper in size and form, but having the shank bare of feathers and scaly: such as the white- or bald-headed eagle, or bald eagle, *H. leucocephalus*, the national emblem of the United States; the white-tailed eagle, *H. albicilla*; the pelagic eagle, *H. pelagicus*, etc.—3. A name of many raptorial birds larger than the hawk and the buzzard, only distantly related, as the harpy eagle, booted eagle, etc. A number of genera of such large hawks are sometimes grouped with the true eagles in a subfamily *Aquilinae* (which see).

4. [cap.] An ancient northern constellation between Cygnus and Sagittarius, containing the bright star Altair. It seems to be shown on Babylonian stones of high antiquity, and the statement still current that it almost touches the equinoctial refers to the position of that circle about 2000 B. C. At present the constellation, enlarged by the addition of Antinous shortly after the Christian era, extends 20° north and 13° south of the equator. See *Aquila*, 2.

5. A military ensign or standard surmounted by the figure of an eagle. It is especially associated with ancient Rome, though borne, with various modifications, by certain modern nations, as France under the first and second empires.

This utter'd, overboard he leaps, and with his *Eagle* feirly advanc'd runs upon the Enemy.
Milton, Hist. Eng., II.

What! shall a Roman sink in soft repose,
And tamely see the Britons aid his foes?
See them secure the rebel Gaul supply;
Spurn his vain *eagles* and his power defy?
Langhorne, Caesar's Dream.

—8. In *arch.*, a name for a pediment.—9. In the game of roulette, a spot, outside the regular 36 numbers, upon which is the picture of an eagle. If this is the winning number, the bank takes in all bets except those made on that particular one. See *roulette*. Also called *eagle-bird*.—American eagle. See *bald eagle*.—Bald eagle, or bald *earn*, a common though misapplied name for the white-headed eagle of North America, *Haliaeetus leucocephalus*. This is the eagle which has been adopted as the national emblem on the arms of the United States, and is figured on some of its coins, being popularly called "the American eagle," "the spread eagle," "the national bird," "the bird of freedom," etc. It is about 3 feet long, dark-brown or blackish when adult, with pure-white head and tail; the shank is partly naked and yellow, by which mark the species may be distinguished in any plumage from the golden eagle, *Aquila chrysaetos*. Also called *white*- or *bald-headed eagle*. See cut on following page.—Black eagle. (a) The golden eagle, *Aquila chrysaetos*. (b) The young of the bald eagle, *Haliaeetus leucocephalus*.—Calumet eagle. See

The number of knights is limited to 30, exclusive of the princes of the blood royal, and all must be of unquestioned nobility. The badge is a cross of 8 points, having in the center a circle with the monogram FR (for *Fredericus Rex*); the four arms are enameled red, with the eagle of Prussia in black enamel between each two arms. The arms of the cross are of white enamel, with an eagle of red enamel between each two arms. The ribbon is striped orange-color and white.—**Order of the White Eagle,** an order founded at the beginning of the eighteenth century by Augustus II. of Poland and Saxony, or, as is alleged, revived by him. It has been adopted by the Czar of Russia, and is composed of one class only. The badge is a cross of 8 points, bearing a white eagle in relief, and surmounted by an imperial crown. The ribbon is sky-blue, but on state occasions the badge is worn pendent to a collar of white eagles connected by plain gold links.—**Spread eagle,** an eagle with outspread wings; specifically, the emblem of the United States of America: often applied attributively to any loud, bombastic, boastful, and arrogant display of national or other sentiments as, a *spread-eagle speech*. In form these masses are spherical, oval, or nearly reniform, or sometimes resemble a parallelepiped with rounded edges and angles. They have a rough surface, and are essentially composed of concentric layers. The nodules often embrace at the center a kernel or nucleus, sometimes movable, and always differing from the exterior in color, density, and fracture. To these hollow nodules the Greeks gave the name of *eaglestones*, from a notion that the eagle transported them to her nest to facilitate the laying of her eggs. Also called *aitēs*.

The organ of hearing; the apparatus of audition; the acoustic sense-organ; any mechanism by which an animal receives the impact of sound-waves and perceives them as sound. In man and mammals generally the ear consists of an external ear, which comprises (1) the more or less funnel-shaped pinna and (2) the external auditory meatus; of a middle ear, or *tympanum*, closed from the external auditory meatus by the tympanic membrane, traversed by a chain of small bones, the auditory ossicles, named *malleus*, *incus*, and *stapes*, and communicating with the pharynx by the Eustachian tube; and of an internal ear, or *labyrinth*, the essential organ of hearing, containing the end-organs of the auditory nerve. The labyrinth consists of a complicated closed sac, the membranous labyrinth, lined with epithe-

Co, concha or external ear, or pinna; *EM*, external auditory meatus; *Ty M*, tympanic membrane; *Inc*, incus; *Malle*, malleus; *ASC*, *PSC*, *ISC*, anterior, posterior, and external semicircular canals; *Coc*, cochlea; *Eu Ty*, Eustachian tube; *IM*, internal auditory meatus, through which the auditory nerve passes to the organ of hearing.

hum and lying in a roughly corresponding excavation in the petrous bone, the bony labyrinth. The membranous labyrinth contains a limpid fluid, the *endolymph*, and between the membranous labyrinth and the bony labyrinth is a similar liquid called *perilymph*. The auditory nerve, penetrating the bone by the internal auditory meatus, is distributed to the walls of the membranous labyrinth. The labyrinth is completely shut off from the tympanum, but there are two fenestrae or openings, closed by membranes, in the tympanic wall of the bony labyrinth, and the foot of the stapes is applied to one of them. Sound waves which impinge upon the tympanic membrane are transmitted across the tympanum by the chain of auditory ossicles, and thence into the labyrinth. In vertebrates below mammals the ear at once becomes simplified, as by lack of an external ear and reduction of the ossicles and of the labyrinth, the latter being simply ligulate or trap-shaped, and, as in fishes, the inner ear may contain one or more concretions, sometimes of great size, called *otoliths* or *ear stones*. An ear of some kind is recognizable in the great majority of invertebrates. In its simplest recognizable expression it is a mere capsule or vesicle, containing some hard body answering to an otolith, and so supposed to have an auditory function. See *cochlea*, *labyrinth*, and *cut* under *tympanic*.

Early English. See *English*.—**Early English architecture**, the pointed style of mediæval architecture in England, which was developed from and succeeded the Norman at the close of the twelfth and in the early part of the thirteenth century. It is characterized in general by purity and simplicity of lines, combined with delicacy, refinement, and grace. The columns and shafts are more slender than those of the preceding style, and the foliage in some instances sprouts out from the central pillar between the shafts; the moldings are more delicately curved, and are alternated with hollows so as to give beautiful effects of light and shade; the capitals frequently have the form of an inverted bell, and are often enriched with foliage, as of the trefoil, rising from the neck-molding and swelling outward beneath the abacus; the towers are loftier and are often crowned by spires; the buttresses project boldly; the vaults are groined, and the graceful wall-arcades often have their spandrels filled with sculpture. The most distinctive features of the Early English style, however, are the pointed arches

and long, narrow, lancet-headed windows, without mullions. Toward the end of the period the windows be-

came grouped in a manner that led to the development of tracery, and the style passed into the Decorated style. Also called the *First Pointed* or *Lancet* style.

A portion of something given or done in advance as a pledge; security in kind; specifically, in *law*, a part of the price of goods or service bargained for, which is paid at the time of the bargain to evidence the fact that the negotiation has ended in an actual contract. =*Syn. Earnest, Pledge.* *Earnest*, like *pledge*, is security given for the doing of something definite in the future, and generally returned when the conditions of the contract have been fulfilled. In 2 Cor. I. 22 and v. 5 we read that the Spirit is given as the *earnest* of indefinite future favors from God; in Blackstone we find "a penny, or any portion of the goods delivered as *earnest*." Whether literal or figurative, *earnest* is always a pledge in kind, a part paid or given in warrant that more of the same kind is forthcoming; as in "Macbeth," I. 3, Macbeth is hailed thane of Cawdor "for an *earnest* of a greater honor." See also "Cymbeline," I. 6. *Pledge* is often used figuratively for that which seems promised or indicated by the actions of the present, *earnest* being preferred for that which is of the same nature with the thing promised, and *pledge* for that which is materially different.

Man, if not yet fully installed in his powers, has given much *earnest* of his claims.

Among Orientals ear-rings have been used by both sexes from the earliest times. In England they were worn by the Romanized Britons and by Anglo-Saxons. After the tenth century the fashion seems to have declined throughout Europe, and ear-rings are neither found in graves nor seen in paintings or sculptures. The wearing of ear-rings was reintroduced into England in the sixteenth century, and Stubbs, writing in the time of Queen Elizabeth, says, "The women are not ashamed to make holes in their ears wherewith they hang rings and other jewels of gold and precious stones." The use of ear-rings by women has continued to the present time. In the seventeenth century they were worn by men; and scarifying men, especially of the southern nations of Europe, have retained the use of them, commonly in the form of gold hoops, down to our own times. Among women the shape of ear-rings changes completely with the fashions, long, heavy pendants being succeeded by smaller ones, and these by single stones in almost invisible chignons, set close to the lobe of the ear.

Usually, but without much probability, referred to the √ *ar, plow, whence ear³, earli², earl, arable, etc.*] 1. The teraqueous globe which we inhabit. It is one of the planets of the solar system, being the third in order from the sun. The figure of the earth is approximately that of an ellipsoid of revolution or oblate spheroid, the axes of which measure 12,756,504 meters and 12,713,012 meters, or 7,926 statute miles and 7,901 statute miles, and 7,899 statute miles and 7,923 statute miles, respectively, thus making the compression 1:293. The radius of the earth, considered as a sphere, is 3,959 miles. The mean density of the whole earth is 5.6, or about twice that of the crust, and its interior is probably metallic. The earth revolves upon its axis in one sidereal day, which is 3 minutes and 55.91 seconds shorter than a mean solar day. Its axis remains nearly parallel to itself, but has a large but slow gyration which produces the precession of the equinoxes. The whole earth revolves about the sun in an ellipse in one sidereal year, which is 365 days, 5 hours, 9 minutes, and 9 seconds. The elliptic, or plane of the earth's orbit, is inclined to the equator by 23° 27' 12". 68 mean obliquity for January 0, 1890, according to Hansen. The earth is distant from the sun by about 93,000,000 miles.

3. The loose material of the earth's surface; the disintegrated particles of solid matter, in distinction from rock; more particularly, the combinations of particles constituting soil, mold, or dust, as opposed to unmixed sand or clay. Earth, being regarded by ancient philosophers as simple, was called an element; and in popular language we still hear of the four elements, fire, air, earth, and water.

6. The hole in which a fox or other burrowing animal hides itself.

Seeing I never stray'd beyond the cell,

But live like an old badger in his *earth*.

Tennyson, Holy Grail.

7. In *chem.*, a name formerly given to certain inodorous, dry, and uninflamable substances which are metallic oxides, but were formerly regarded as elementary bodies. They are insoluble in water, difficultly fusible, and not easily reduced to the metallic state. The most important of them are alumina, zirconia, glucina, yttria, and thorina. The alkaline earths, baryta, strontia, lime, and magnesia, have more the properties of the alkalis, being somewhat soluble in water, and having an alkaline taste and reaction.

8. In *elect.*: (a) The union of any point of a telegraph-line, submarine cable, or any system of conductors charged with or conveying electricity with the ground. It is generally made by joining the point at which the earth is to be established by means of a good conductor with a metallic plate buried in moist earth, or with metallic water-pipes or gas-pipes, which, on account of their large surface of contact with the earth, usually afford excellent earth-connections. (b) A fault in a telegraph-line or cable, arising out of an accidental contact of some part of the metallic circuit with the earth or with more or less perfect conductors connected with the earth.—*Adamic earth*. See *Adamic*.—*Axis of the earth*. See *axis*.—*Bad earth*, in *elect.*, a connection with the earth in which great resistance is offered to the passage of the current.—*Black earth*, a kind of coal which is pounded fine and used by painters in fresco.—*Chian earth*. See *Chian*.—*Cologne earth*, a kind of light bastard ochre, of a deep-brown color, transparent, and durable in water-color painting. It is an earthy variety of lignite or partially fossilized wood, and occurs in an irregular bed from 30 to 50 feet deep near Cologne, whence the name.—*Compression of the earth*. See *compression*.—*Dead earth*, or *total earth*, in *elect.*, an earth-connection offering almost no resistance to the passage of the current, as when a telegraph-wire falls upon a railroad-track, or when the conductor of a submarine cable has a considerable surface in actual contact with the water.—*Earth of alum*, a substance obtained by precipitating the earth from alum dissolved in water by adding ammonia or potassa. It is used for paints.—*Earth of bone*, a phosphate of lime existing in bones after calcination.—*Ends of the earth*. See *end*.—*Figure of the earth*, the shape and size, not of the earth's surface, but of the mean sea-level continued under the land at the heights at which water would stand in canals open to the sea; also, the generalized figure or ellipsoid which most nearly coincides with the figure of the sea-level.

If Lactantius affirm that the *figure of the earth* is plane, or Austin deny there are antipodes, though venerable fathers of the church and ever to be honoured, yet will not their authorities prove sufficient to ground a belief thereon. *Sir T. Browne, Vulg. Err., I. 7.*

Good earth, in *elect.*, a connection with the earth in which the current meets with little resistance in its passage from the wire or conductor to the earth.—*Heavy earth*. Same as *baryta*.—*Intermittent earth*, in *elect.*, an earth-connection such as is produced by a wire touching at intervals conducting bodies in connection with the earth.—*Magnetic poles of the earth*. See *magnetic*.—*Partial earth*, in *elect.*, a poor earth-connection, such as exists when a telegraph-wire rests upon the ground, when its insulators are defective, or when it touches any conductor connected with the earth, but offering considerable resistance.—*To bring to the earth*, to bury. *Eng. Gilds*.—*To put to earth*, in *elect.*, to join or connect a conductor with the earth. *To run to earth*, in *hunting*, to chase the game, as a fox, to its hole or burrow.—*Syn.*

1. *Earth, World, Globe*. *Earth* is used as the distinctive name of our planet in the solar system, as Mercury, Venus, Earth, Mars, etc. It is used not only of soil, but of the planet regarded as material, and also as the home of the human race. (See Job i. 7; Ps. lvi. 11.) *World* has especial application to earth as inhabited; hence we say, he is gone to a better *world*; are there other *worlds* besides this? It belongs, therefore, especially to the surface of the earth; hence we speak of sailing around the *world*, but not the *earth*. *Globe* makes prominent the roundness of the earth: as, to circumnavigate the *globe*. The first man is of the *earth*, earthy. *1 Cor. xv. 47.*

The Sun flies forward to his brother Sun;

The dark *Earth* follows wheel'd in her chariot.

The more advanced form has two or three chambers. The AS. words were *earth-bifung*, -*beofung* (*bifung*, trembling), *earth-dyne* (*dyne*, din), *earth-styrung* (*styrung*, stirring), *earthstyrennis*. Cf. *earth-din*.] A movement or vibration of a part of the earth's crust. Such movements are of every degree of violence, from those that are scarcely perceptible without the aid of apparatus specially contrived for the purpose to those which overthrow buildings, rend the ground asunder, and destroy thousands of human lives. The duration of earthquakes is as variable as their intensity. Sometimes there is a single shock, lasting only a second or two; at other times a great number of shocks occur in succession, separated by greater or less intervals of time, the earth not being reduced to complete quiescence for weeks or even months. It is not known that any portion of the earth's surface is entirely exempt from earthquakes; but there are large areas where no very destructive ones have ever occurred, either in the memory of man or as recorded in history. The regions most frequently visited by destructive shocks are those where active volcanoes exist, those near high mountain-ranges, and those where the rocks are of recent geological age, and are much disturbed or uplifted. Such regions are the vicinity of the Mediterranean, the shores of the Pacific and the adjacent islands, the neighborhood of the Alps, and the East India islands. Regions not liable to seismic disturbances are the whole of northeastern North America, the east side of South America, the north of Asia, and a large part of Africa. An earthquake-shock is a wave like motion of a part of the earth's crust, and, in the words of Humboldt, is one of the ways in which the reaction of the interior of the earth against its exterior makes itself manifest. The most destructive earthquake of which we have any knowledge was that of Lisbon. It began November 1st, 1755, and was felt over that part of the earth's surface included between Iceland on the north, Mogador in Morocco on the south, Toplitz in Bohemia on the east, and the West India islands on the west. The destruction of life and property occasioned by this shock was very great. The disturbance continued, especially in the vicinity of the Mediterranean, with short intermissions, for several months. On November 18th, 1755, the most violent shock occurred which has been felt in New England since its settlement by the whites. One of the most destructive earthquakes of recent occurrence was that which took place on the island of Ischia near Naples, July 28th, 1883, by which over 2,000 persons perished. By the earthquake at Mendoza, South America, on the 20th of March, 1861, over 12,000 persons lost their lives. A violent earthquake, most destructive in Charleston, South Carolina, and vicinity, occurred on the night of August 31st, 1886. See *seismic*, *seismometer*, and *volcanism*.

Brit.*, XXI. 626.

In *engin.*, any operation in which earth is removed or thrown up, as in cuttings, embankments, etc.—2. In *fort.*, any offensive or defensive construction formed chiefly of earth: commonly in the plural. Hence —3. Any similar construction, as the ancient mounds of earth found in various parts of the United States, of unknown use and origin. They differ widely in form, but are always well defined in plan, and sometimes inclose large areas.

Anyhow, there the mound is, an *earthwork* which, if artificial it be, the Lady of the Mercians herself need not have been ashamed of. *E. A. Freeman*, *Venice*, p. 30.

earthworm (érth'wërm), *n.* [= D. *aardworm* = G. *erdwurm*; < *earth* + *worm*.] 1. The common name of the worms of the family *Lumbricidae* (which see), and especially of the genus *Lumbricus*, of which there are several species, one of the best-known being *L. terrestris*. They belong to the order of oligochaetous annelids. The earthworm has a cylindric vermiform body, tapering at both ends, segmented into a great number of rings, destitute of legs, eyes, or any appendages visible on ordinary inspection. It moves by the contraction of the successive segments of the body, aided by rows of bristles which are capable of being retracted. It is hermaphrodite, each individual of a pair impregnating the other in copulation, when the two are joined in two places by their respective clitella. Earthworms are highly useful, giving a kind of under-tillage to the land, loosening the soil, and rendering it more permeable to the air. According to Darwin, in his work on "The Formation of Vegetable Mould," etc., earthworms, from their enormous numbers, exercise a highly important agency not only in this respect, but in the creation and aggregation of new soil, the burial and preservation (as also the original disintegration) of organic remains of all kinds, etc. They are food to many birds, mammals, and other animals, and their value for bait is well known to the angler, whence they are often called *anglerworms* or *fishworms*. These worms are mostly a few inches long, but there are species attaining a length of a yard or more.

The people who inhabit the highlands of Southern Brazil have a firm belief in the existence of a gigantic *earthworm* fifty yards or more in length, five in breadth, covered with bones as with a coat-of-mail, and of such strength as to be able to uproot great pine-trees as though they were blades of grass, and to throw up such quantities of clay in making its way underground as to dam up streams and divert them into new courses. This redoubtable monster is known as the "Minhocão."

One of the four cardinal points of the compass, opposite to the west, and lying on the right hand when one faces the north; the point in the heavens where the sun is seen to rise at the equinox, or the corresponding point on the earth. As early as the second century it was the established custom for Christians to pray facing the east. From this resulted the custom of building churches with the altar and sanctuary at the east end and the main entrance at the west end, and of

using the terms in this way even with respect to churches not so built.

Easter¹ (ēs'tēr), n. and a. [*ME. ester*, earlier *aster*, *asterne*, also *esterne*, *easterne* (orig. pl.), < *AS. eastre*, generally pl., nom. *eastro*, gen. *eastrona*, dat. *eastron*, *eastran*, also *eastor*, *easter-*

(only in comp. and in ONorth. gen. *eastres*), Easter, = *OHG. ostarā*, pl. *ostarūn*, *MHG. öster*, generally pl. *ostern*, *G. ostern* (in comp. *oster-*), Easter; orig. a festival in honor of the goddess of Spring, = *AS. *Edstra*, whose name as such is given by Bede in the dial. form *Eōstra* = *OHG. *Ostarā*, etc.: see *east*, n.] I. n. A festival observed in the Christian church, from early times, in commemoration of the resurrection of Jesus Christ. It corresponds with the Passover of the Jews, which in the King James version of the Bible is called once by the name of *Easter* (Acts xii. 4). The name appears several times in earlier versions. Easter is observed by the Greek, Roman Catholic, Episcopal, and Lutheran churches, and by many among the non-liturgical churches who do not generally regard the church year. The esteem in which it is held is indicated by its ancient title, "the great day." Easter is the Sunday which follows that 14th day of the calendar moon which falls upon or next after the 21st day of March. This is true both of old style and new, and the rule has been used, though not universally, from a very early day.

The northern Irish and Scottish, together with the Picts, observed the custom of the Britons, keeping their Easter upon the Sunday that fell between the xiv. and the xx. day of the Moon.

Abp. Ussher, Religion of the Anc. Irish, ix., in Wordsworth's Church of Ireland, p. 64.

Gauss's Rule for finding the date of Easter. First, take *x* and *y* out of the following table:

	<i>x</i>	<i>y</i>
Old style	16	6
New style, A. D. 1583-1699	22	2
" " 1700-1799	23	3
" " 1800-1899	23	4
" " 1900-2099	24	5

Second, calculate the five numbers *a*, *b*, *c*, *d*, *e*, by the following rules, where *N* is the number of the year:

a is the remainder after the division of *N* by 19.
b is the remainder after the division of *N* by 4.
c is the remainder after the division of *N* by 7.
d is the remainder after the division of $19a + x$ by 30.
e is the remainder after the division of $2b + 4c + 6d + y$ by 7.

Third, then $d + e + 22$ is the day of March, or $d + e - 9$ is the day of April on which Easter falls, except that when this rule gives April 23th the true day is April 19th, and when the rule gives April 26th, if $d = 28$ and $a > 10$, then the true date is April 18th.

Easter eve (sometimes *Easter even*), the day before Easter Sunday; Holy Saturday; the end of Lent and the prelude to the festival of Easter. In the early church Good Friday and Easter eve were observed as a strict and continuous fast till after midnight of the latter, the whole night before Easter day being passed in continual worship and in listening to lectures and sermons. During this vigil the churches, and frequently the streets, were brilliantly lighted, the worshippers also bringing lamps and tapers with them. Two ancient ceremonies of Easter eve, still retained in the Roman Catholic Church, are the benediction of the paschal taper (see *paschal* and *exultet*), a custom which is said to have originated in the fifth century, and the benediction of the font. Easter eve was the chief time for baptism in the early church.

We have a very common expression to describe a man in a state of *ebriety*, that "he is as drunk as a beast," or that "he is beastly drunk." J. D'Israeli, Curios. of Lit., III. 32.

ébrillade (F. pron. ā-brē-lyād'), *n.* [F., < It. *sbrigliata*, a pull of the bridle, check, reproof, < *sbrigliare*, unbridle, undo, loosen, < *s-* (< L. *ex-*), out, + *briglia*, bridle.] In the *manège*, a check given to a horse by a sudden jerk of one rein when he refuses to turn.

ebriosity (ē-bri-ōs'i-ti), *n.* [Formerly *ebriositie*; = F. *ébriosité*, < L. *ebriositas* (-is), < *ebriosus*, given to drink, < *ebrius*, drunken: see *ebrius*.] Habitual drunkenness. [Rare.]

That religion which exorceth . . . Noah in the aged surprisal of six hundred years . . . will neither acquit *ebriosity* nor *ebriety* in their known and intended perversions. Sir T. Browne, Vulg. Err., v. 21.

Of all *ebriosity*, who does not prefer to be intoxicated by the air he breathes? Thoreau, Walden, p. 234.

ebrius (ē'bri-us), *a.* [= F. *ébricus* = Sp. Pg. *ebrioso* = It. *ebrioso*, *ebrioso*, < L. *ebrius*, drunken.] Given to indulgence in drink; drunken; drunk; intoxicated. [Rare.]

ebuccinator (ē-buk'ē-nā-tor), *n.* [L. *e-*, out, + *buccinator*, prop. *bucinator*, a trumpeter: see *buccinator*.] A trumpeter. [Rare.]

The *ebuccinator*, shewer, and declarer of these news, I have made Gabriel, the angel and ambassador of God. Bacon, Works, I. 43.

ebulliate (ē-bul'yāt), *v. i.* [Improp. for **ebullire*, < L. *ebullatus*, pp. of *ebullare*, for the more correct L. *ebullire*, boil up: see *ebullient*.] To boil or bubble up; effervesce.

Whence this 29 play-oppugning argument will *ebulliate*. Prynn, Histrio-Mastix, I. iv. 3.

ebullience, ebullency (ē-bul'yens, -yēn-si), *n.* [L. *ebullient*: see *ebullire*, < *ebullire*.] A boiling over; a bursting forth; overflow.

The natural and enthusiastic fervour of men's spirits, and the ebullency of their fancy. Cudworth, Sermons, p. 93.

The absence of restraints—of severe conditions—in the art allows a flush and ebullency, an opulence of production, that is often called the highest genius. A. Bain, Corr. of Forces.

ebullient (ē-bul'yent), *a.* [L. *ebullien* (-is), pp. of *ebullire*, boil out or up, < *e-*, out, + *bullire*, boil: see *boil*?] Boiling over, as a liquid; overflowing; hence, over-enthusiastic; over-demonstrative.

Mr. Brookfield presents an amusing type of a prolix and ebullient old actor. Athenæum, Jan. 14, 1888, p. 60.

ebullioscope (ē-bul'yō-skōp), *n.* [= F. *ébullioscope*, irreg. < L. *ebullire*, boil up, + Gr. *σκοπεῖν*, view.] An instrument by which the strength of spirit of wine is determined by the careful determination of its boiling-point.

ebullition (ēb-u-lish'ōn), *n.* [= OF. *ebullicion*, F. *ébullition* = Pr. *ebullicio* = Sp. *ebullicion*, *ebullicion* = Pg. *ebullicão* = It. *ebullizione*, < L. *ebullitio* (-is), < L. *ebullire*, boil up: see *ebullient*.] 1. The bubbling up or agitation which results from the action of heat on a liquid, owing to the lowest portions becoming gaseous and escaping; a boiling up or over. The temperature at which ebullition takes place varies with the liquid, and when performed in the open air with the pressure of the atmosphere, being higher when the pressure is increased, and lower when it is diminished. See *boiling-point*.

It is possible to heat water 20° F. above its boiling-point without ebullition. Clerk Maxwell, Heat, p. 25.

2. Any similar agitation, bubbling up, or disturbed or seething condition or appearance, produced by causes other than heat, as when rapidly flowing water encounters numerous obstacles or contrary currents.

The chafing of the water against these huge obstacles [rocks of granite], the meeting of the contrary currents one with another, creates such a violent ebullition, . . . that it fills the mind with confusion. Bruce, Source of the Nile, I. 156.

3. Effervescence occasioned by fermentation or by any other process which causes the evolution of an aeriform fluid, as in the mixture of an acid with a carbonated alkali. [In this sense formerly *bullition*.] We cannot find it to hold neither in iron or copper, which is dissolved with less ebullition. Sir T. Browne, Vulg. Err., iv. 7.

4. Figuratively, an outward display of feeling; a sudden burst; a pouring forth; an overflowing: as, an ebullition of passion. The greatest ebullitions of the imagination. Johnson.

Disposed to refer this to inexperience, or the ebullition of youthful spirit. Prescott, Ford, and Isa., I. 3.

It was not an extravagant ebullition of feeling, but might have been calculated on by any one acquainted with the spirits of our community. Emerson, Hist. Discourse at Concord.

=Syn. Ebullition, Effervescence, Fermentation. Ebullition is a boiling out or up; the word may be applied figuratively to that which suggests heated or intense activity. Effervescence is not the result of heat or of the escape of steam, but of the escape of gas from a liquid. Fermentation is a process often invisible, often taking place in solids, and sometimes producing effervescence in liquids.

(a) By Lamarck it was made to include the ivory-shell *E. glabrata*, as well as turreted species of the family *Buccinidae*. (b) By most later writers the typical species has been referred to the *Olividae* and the genus restricted to buccinids, like *E. epirata*, which are by others designated as the genus *Latrun-culus*. As thus limited, it is remarkable for the oblong-ovate form, turreted spire, and flatish upper or sutural surface of the whorls, deep umbilicus, and thick porcellaneous texture. The color is also characteristic, reddish spots being distributed on a white ground. (c) By a few the genus is restricted to the ivory-shell *E. glabrata*, by others called *Dipacna*. There are about 14 species, found in China, etc.; some are used for food.

The players having cut for the deal, which is decided by the highest card, the dealer gives five cards to each player, three and two at a time, and turns up the eleventh card for trump. If he turns up a king, he scores one; and if the king of trumps occurs in the hand of either player, the holder may score one by announcing it before playing. The cards rank as follows: king (highest), queen, knave, ace, ten, etc. A player having a higher card of the suit led must take the trick with such a card; if he cannot follow suit, he may play a trump or not, as he chooses. Three tricks count one point, five tricks (called a *pot*) two points, and five points make game. Before play begins the non-dealer may propose—that is, claim the right to discard (*écarter*) any of the cards in his hand, and have them replaced with fresh ones from the pack. Should he do so, both can discard as many cards as they choose.

Ecaudata (ē-kā-dā'tā), *n. pl.* [NL., neut. pl. of *ecaudatus*: see *ecaudate*.] In *herpet.*, the *Anura* or tailless batrachians: opposed to *Caudata* or *Urodela*.

Squirting Cucumber (*Ecballium Elaterium*).

named because the fruit when ripe separates suddenly from its stalk, and at the same moment forcibly expels the seeds and juice from the aperture left at the base. A precipitate obtained from the juice is the elaterium of medicine, a very powerful hydragogue cathartic. See *elaterium*.

ecbasis (ek-bā'sis), *n.* [= *F. ecbase, < L. ecbasis, < Gr. ἐκβασις, a going out, issue, event, < ἐκ, out, + βαίνω, go, come: see base², basis.*] An argument drawn from the relation of cause and effect; especially, an argument for or against a certain course of action, such as the passage of a proposed bill or law, from a consideration of probable consequences.

ecbatic (ek-but'ik), *a.* [*< Gr. as if *ἐκβατικός, < ἐκβαίνειν, happen: see ecbasis.*] Relating to an event that has happened; denoting a mere result or consequence, as distinguished from *telic*, which implies purpose or intention. Thus, the sentence "Events fell out so that the prophecy was fulfilled" is *ecbatic*; but the sentence "Events were arranged in order that the prophecy might be fulfilled" is *telic*.

ecblastesis (ek-blast'ē-sis), *n.* [*NL., < Gr. ἐκ-βάσσω, a shooting or budding forth, < ἐκ, out, + βάσσω, shoot or sprout out, < ἐκ, out, + βάσσω, sprout.*] In *bot.*, axillary proliferation in the flower: a term applied by Engelmann to the occurrence of adventitious buds in the axils of one or more parts of the flower.

ecce homo (ek'sē hō'mō), [*L.: ecce, a demonstrative adv. or interj., here (he or it is)! lo! behold! prob. orig. *ecce, < *e, locative of pron. i-s, e-a, i-d, this, he, she, it, + demonstrative suffix -ce; homo: see Homo.*] Behold, the man: a phrase commonly used to denote Christ crowned with thorns, considered as a subject for a work of painting or sculpture, from the words with which he was presented by Pilate to the Jews (John xix. 5). This subject has been frequently chosen by artists since the fifteenth century, among its most celebrated examples being paintings by Correggio, Titian, H. Caracci, Guido Reni, Van Dyck, and Verelst.

ecceity (ek-sē'i-ti), *n.* [*< ML. ecceitas (occurring in the 16th century as a modification of the earlier haecceitas, due to the fact that the formation of the latter word was not understood), < L. ecce, lo! in LL. and ML. an assistant pron. or adv., this, here: see ecce homo.*] Same as *haecceity*.

eccentric (ek-sen'trik), *a. and n.* [Formerly also *eccentrick*; = *F. excentrique* = *Pr. exen-*

tric = *Sp. excentrico* = *Pg. excentrico* = *It. eccentrico* = *D. excentrick* (cf. *D. excentrisch* = *G. excentrisch* = *Dan. Sw. excentrisk*), *< NL. eccentricus, < LL. eccentricos, < Gr. ἐκκεντρος, out of the center, < ἐκ, out, + κέντρον, center: see center¹.*] I. *a.* 1. Not located or situated in the center; away from the center or axis: as, in botany, lateral embryos and the stipes of some hymenomycetous fungi are said to be *eccentric*.

The astronomers discover in the earth no centre of the universe, but an *eccentric* speck.

Huxley, Lay Sermons, p. 16.
A complete neural circulation, however, is by no means the necessary condition of a sensibility independently located in *eccentric* portions of the human body such as Mr. Lewes supposes. G. S. Hall, German Culture, p. 234.

2. In *med.*, not originating or existing in the center or central parts; due to peripheral causes: as, *eccentric* irritation; *eccentric* convulsions (that is, convulsions due to peripheral irritation). —3. Not coincident as regards center; specifically, in *geom.*, not having the same center: applied to circles and spheres which have not the same center, and consequently are not parallel: opposed to *concentric*, having a common center. Hence —4. Not coincident as regards course or aim; tending to a different end or result; devious.

Whoever affairs pass such a man's hands, he crooketh them to his own ends, which must needs be often *eccentric* to the ends of his master or State.

Bacon, Wisdom for a Man's Self (ed. 1887).

Women's Affections are *eccentric* to common Apprehension; whereof the two poles are Passion and Inconstancy. Baker, Chronicles, p. 226.

6. Of or pertaining to an *eccentric*: as, the *eccentric* anomaly of a planet; the *eccentric* rod of a steam-engine.

In senses 3 and 6 sometimes written *excentric*.

Eccentric angle, in *geom.*, an angle connected with an ellipse and defined as follows: Let ABDE be an ellipse. Upon the transverse axis AB as a diameter erect the circle ABFG. Then, taking any point on the ellipse, as H, let fall the perpendicular HK upon the transverse axis AB, and continue this perpendicular until it cuts the circle at the point L on the same side of the transverse axis AB. Join L with the common center, C, of the ellipse and circle. Then, the angle BCL, reckoned from one determinate end, B, of the transverse axis, is called the *eccentric angle* of the point H. The expression is derived from *eccentric anomaly*.

—**Eccentric anomaly**. See *anomaly*. —**Eccentric cam**, a circular disk used as a cam, in which the center of rotation is outside the center of figure. —**Eccentric chuck**. See *chuck⁴*. —**Eccentric circle**. Same as *II. 1*. —**Eccentric cutter**. See *cutter*. —**Eccentric equation**. See *hypertrophy*. —**Eccentric place** of a planet, its place as seen from the center of its orbit. —**Eccentric theory**, a theory of the sun's motion which uses an *eccentric* in place of an epicycle. —**Eccentric wheel**, a wheel which is fixed on an axis that does not pass through the center. Its action is that of a crank of the same length as the eccentricity. See *II. 2*. —**Syn. 5. Eccentric, Singular, Strange, Odd, Queer, Whimsical, peculiar, erratic.** *Eccentric* is applied to acts which are the effects of tastes, prejudices, judgments, etc., not merely different from those of ordinary people, but largely unaccountable and often irregular, or to the person who thus acts. *Singular* implies that a thing stands alone in its kind or approximately so; practically, the word expresses some disapprobation: as, a *singular* fellow or performance; while *eccentric* people are generally the objects of good-humored interest. *Strange* implies that the thing or its cause is unknown: as, a very *strange* proceeding; a *strange* insect; but what is *strange* to one man may not be so to another; what is *strange* to most or all is *singular*. *Odd*, unpaired, starts from the same idea as *singular*; when applied to personal appearance, it implies singularity and grotesqueness: as, an *odd* figure; when applied to the mind or habits, it is nearly equivalent to *eccentric*, but is somewhat stronger: as, he is very *odd*; he has *odd* ways; when applied to actions or conditions, it frequently implies some degree of wonder, and is then nearly the same as *surprising*: as, it is *odd* that he does not write. *Quder* often expresses a singularity that is droll. *Whimsical* is nearer to *eccentric*, applying to one who often acts upon capricious and irregular fancies of a rather amusing kind. For connection with *quaint*, see *ancient*. See also *wonderful, irregular, fanciful*.

Yet in all these scores (of Shakspere's characters) hardly one . . . is to be found which deviates widely from the common standard, and which we should call very *eccentric* if we met it in real life. Macaulay, Madame D'Arblay.

And the breeches, and all that,
Are so queer.

Lowell, Study Windows, p. 6.

II. *n.* 1. (*a*) In *anc. astron.*, a circle having its center remote from the earth and carrying an epicycle which in its turn was supposed to carry a planet.

Or if they list to try
Conjecture, he his fabric of the heavens
Hath left to their disputes; perhaps to move
His laughter at their quaint opinions wide
Hereafter, when they come to model heaven
And calculate the stars; how they will wield
The mighty frame; how build, unbuild, contrive,
To save appearances; how gird the sphere
With centric and *eccentric* scribbled o'er,
Cycle and epicycle, orb in orb. Milton, P. L., viii. 83.

(*b*) In *mod. astron.*, a circle described about the center of an elliptical orbit, with half the major axis for radius. —2. In *mech.*, a device for converting a regular circular motion into an irregular reciprocating rectilinear motion. It acts upon the body moved by it through its perimeter like a cam, with which it is sometimes classed; but all its peculiarities of motion are essentially those of a crank-motion, and it may be considered as a crank having a wrist of larger diameter than the throw. In the steam-engine it is a disk fitted to the shaft, with its center placed at one side of the center of the shaft, and it acts to convert the rotary motion of the shaft into the reciprocating motion of the valve-gear of the cylinder, and thus to make the engine self-acting. (See *link-motion, reversing-gear, and cut-off*.) In this sense sometimes written *excentric*.

3. One who or that which is irregular or anomalous in action; a person of *eccentric* habits.

Mr. Farquhar added another to his gallery of middle-aged *eccentrics*. Athenæum, Jan. 14, 1888, p. 60.

Angular advance of an eccentric. See *angular*. —**Eccentric of the eccentric**, a circle whose center is remote from the earth (in the Ptolemaic theory) or from the sun (in the Copernican), and which carries round its circumference a second circle, called the *eccentric*, and this again a third, called the *epicycle*, which carries a planet. An *eccentric of an eccentric* was supposed by Ptolemy to explain the motion of Mercury, and by Copernicus to explain the motions of Mercury and Venus. Tycho suggested such an explanation for the motions of Mars. — **Equation of the eccentric**. See *equation*.

eccentric (ek-sen'tri-kəl), *a.* Same as *eccentric*.

eccentrically (ek-sen'tri-kəl-i), *adv.* With *eccentricity*; in an *eccentric* manner or position. Also *excentrically*.

Who, less *eccentrically* wild,
Inverts the misanthropic plan,
And, hating vices, hates not man.
Lloyd, Familiar Epistle.

eccentric-gear (ek-sen'trik-gēr), *n.* In *mech.*, a term including all the links and other parts which transmit the motion of an *eccentric*.

eccentric-hoop (ek-sen'trik-hüp), *n.* Same as *eccentric-strap*.

Sw. excentricitet*, *< NL. eccentricita(t)-s, < eccentricus, eccentric: see eccentric.*] 1. Deviation from a center; the state of a circle with reference to its center not coinciding with that of another circle. —2. In *geom. and astron.*, the distance between the foci of a conic divided by the transverse diameter. The eccentricity of the earth's orbit is .01677, or about $\frac{1}{60}$. —3. In *anc. astron.*, the distance of the center of the equant from the earth. —4. Departure or deviation from that which is stated, regular, or usual; oddity; whimsicalness: as, the *eccentricity* of a man's genius or conduct.

Akenside was a young man warm with every notion connected with the sound of liberty, and by an *eccentricity* which such dispositions do not easily avoid, a lover of contradiction, and no friend to anything established.
Johnson, Akenside.

5. An *eccentric* action or characteristic; a striking peculiarity of character or conduct.

Whose [Frederic William's] eccentricities were such as had never before been seen out of a mad-house.

Macaulay, *Frederic the Great*.

Also *eccentricity* in the literal uses.

Angle of eccentricity, in *geom.*, the angle whose sine is equal to the eccentricity of an ellipse.—**Bisection of the eccentricity**. See *bisection*.—**Temporal eccentricity**, in *anc. astron.*, the eccentricity of the orbit of Mercury at any time. Since the eccentric of Mercury was supposed itself to be carried on an eccentric, it follows that the eccentricity would not be a constant quantity.

But *preacher*, in its modern signification, is not synonymous with the original. (See the etymology.) Ecclesiastical books, in the early church, books allowed to be read in church, especially those read for edification and for the instruction of catechumens, but not belonging in the strictest sense to the canon of Scripture. This name was applied to such books as those named in the sixth of the Thirty-nine Articles of the Church of England, after the canonical books of the Old Testament, as "the other books," and collected in the King James Bible under the heading "Apocrypha." **Ecclesiastical calendar**. See *calendar*.—**Ecclesiastical colors**. See *color*.—**Ecclesiastical commission**. (*a*) A court appointed by Queen Elizabeth, and invested by her with nearly absolute powers, for the purpose of regulating religious opinions, and punishing all departure from the church standards either in doctrine or in ritual. It was subsequently abolished by Parliament. (*b*) A standing commission in England, created by Parliament in the early part of the nineteenth century, invested with important powers for the reform of the established church. Its plans have to be submitted, after due notice to persons interested, to the sovereign in council, and be ratified by orders in council; but after ratification and due publication they have the same effect as acts of Parliament.—**Ecclesiastical councils**. See *council*. 7.—**Ecclesiastical courts**, church courts in which the canon law is administered and ecclesiastical causes are tried. In countries in which the church is established by law the decisions of these courts have a binding legal effect, and the courts constitute a part of the judicial machinery of the community; in other countries their decisions are binding only within the church, and enforced only by church discipline. In England there are several ecclesiastical courts. That of primary resort is the Consistory Court of the diocese, from it appeals go to the Court of Arches, and from there to the Privy Council. In the Protestant Episcopal Church of America the administration of discipline of lay members is wholly in the hands of the rector, an appeal lying to the bishop. The method of proceeding against clergymen in each diocese is determined by diocesan canons. A bishop is tried by the House of Bishops. In the Presbyterian Church the ecclesiastical courts are the Session, Presbytery, Synod, and General Assembly, the last being the court of last resort: in the Methodist Church trials are had before a church committee, with an appeal to the Conference. In both churches there are provisions for the constitution of courts for the trial of clergymen for false doctrine or immoral conduct. In churches of the Congregational system there are no ecclesiastical courts; the local church is the only tribunal recognized. In the Roman Catholic Church there are bishops' courts for the trial of ordinary church causes, the trial of bishops being reserved to the pope; but the methods of procedure differ according to the position of the church in different countries.—**Ecclesiastical epistles**, in the *Rom. Cath. Ch.*, letters written by church dignitaries officially, and carrying with them ecclesiastical authority, as apostolic epistles written by the Roman pontiff in virtue of his apostolic authority, commendatory epistles (see *commendatory*), dismissory epistles (see *dismissory*), encyclical epistles (see *encyclical*), pastoral epistles, and epistles of instruction to particular churches.—**Ecclesiastical fast**. See *fast*.—**Ecclesiastical history**, the history of the church from the beginning to the present time, including both Old Testament and New Testament history; more specifically, the history of the Christian church, including both its interior and its exterior development—that is, its organization and also the development of its doctrine and beliefs.—**Ecclesiastical law**, the law of the church as administered in the ecclesiastical courts; in a more general sense, especially in those countries where there is no church establishment, the whole body of the law relating to religion or religious institutions as administered in the civil courts.—**Ecclesiastical mode**. See *mode*.—**Ecclesiastical moon**, or *calendar moon*, a fictitious month used in determining the date of Easter. It is made purposely to depart from the natural month, to avoid the possibility of a coincidence of Easter with the Jewish Passover.—**Ecclesiastical notary**. See *notary*.—**Ecclesiastical polity**, the principles and laws of church government.—**Ecclesiastical state**, the body of the clergy.

The ventrals are thoracic in position, and have 5 rays, and a slender spine closely attached to the adjoining ray. na. Forster, 1778. [Not in use.] — 2. In *herpet.*, a genus of reptiles: used by Wagler and others for the genus of vipers (*Viperidae*) called *Bitis* by Gray and Cope. Merrem, 1820. They have 5 toes on each foot; the snout is straight and moderately developed. *Tachyglossus* is the same, and is the name properly to be used for this genus according to zoological rules of nomenclature, the name *Echidna* having been preoccupied in another sense, though it has most currency in this sense. See *Acanthoglossus*, ant-eater. Cuvier, 1797. (b) [l. c.] A species of the genus *Echidna* or family *Echidnidae*. The echidna resembles a large hedgehog, excepting that the spines are much longer, and the snout is long and slender, with a small aperture at the end for the protrusion of the long, flexible, worm-like tongue. The animal is nocturnal, fossorial, and insectivorous, and catches insects with its long, sticky tongue, whence it is known as the *porcupine ant-eater*. The echidna is closely related to the *Ornithorhynchus*, or duck-billed platypus, and, like it, is oviparous.

4. A genus of echinoderms. De Blainville, 1830. **Echidnæ** (e-kid'nē), *n. pl.* [NL., pl. of *echidna*, < L. *echidna*, an adder, viper: see *Echidna*.] A group of bombycid moths. Associated with the albumin is a peculiar nitrogenous body, to which the name *echidnine* is more particularly applied. The poison-bag of a viper seldom contains more than 2 grains of the poisonous liquid; a 1/2 of a grain is sufficient to kill a small bird.

the so-called hydatids occurring in the liver, brain, etc., of man and other animals; the hydatid form of the wandered scolex of *Taenia echinococcus*, having deutoscotices or daughter-cysts formed by gemination. This hydatid is that of the tapeworm of the dog, having several tania-heads in the cyst; it may occur in man, commonly in the liver, giving rise to very serious disease. The word was originally a genus name, given by Rudolphi before the relationship to *Taenia* was known; it is now used as the name of the larval stage of the tapeworm whose specific name is the same. See cut under *Taenia*.

In *Echinococcus* the structure of the cystic worm is complicated by its proliferation, the result of which is the formation of many bladder-worms, inclosed one within the other, and contained in a strong laminated sac or cyst, apparently of a chitinous nature, secreted by the parasite. *Huxley, Anat. Invert.*, p. 186.

II. *n.* Any one of the *Echinodermata*.

All *echinoderms* have a calcareous skeleton, and many are provided with movable spines. A characteristic apparatus of vessels, termed the ambulacral or water-vascular system, is present. It is composed of a ring round the pharynx, from which proceed a number of radiating canals, commonly giving off several appendages (Pallan vesicles), as well as branches which enter the retractile tube-feet, often furnished with a terminal disk or sucker, which with the spines are the organs of locomotion. The madreporic canal connects the pharyngeal ring with the exterior. *Pearce, Zool. Class.*, p. 40.

Echinodermata (e-kī-nō-dēr-mā-tā), *n. pl.* [NL., neut. pl. of *echinodermatus*; see *echinodermatous*.] A phylum or subkingdom of metazoic animals; the echinoderms. They represent one of the most distinct types of the animal kingdom, agreeing with coelenterates in having a radiate or actinomorphic arrangement of parts, usually pentamerous or by fives or tens, a digestive canal, a water-vascular or ambulacral apparatus, a true blood-vascular system, and the integument indurated by calcareous deposits, as either granules, spicules, or hard plates forming a shell. The alimentary canal is distinct from the general body-cavity; there is a deuterostomatous oral orifice or mouth, and usually an anus. The sexes are mostly distinct. The species undergo metamorphosis; the free-swimming ciliated embryo is known as a *pluteus*, in some cases as an *echinopluteum* (see cut under *echinopluteum*); the adult form is usually assumed by a complicated kind of secondary development from the larval form, which is mostly bilateral. The *Echinodermata* were so named by Klein in 1734, and in Cuvier's system were the first class of his *Radiata*; they are still sometimes reduced to a class with the *Ctenophora*. As a subkingdom they are divisible into four classes: *Crinoidea*, *Echinoidea*, *Asteroidea*, and *Holothuroidea*, or the crinoids, sea-urchins, starfishes, and sea-cucumbers. As a class they are sometimes divided directly into seven orders: *Echinoidea* (sea-urchins), *Asteroidea* (starfishes), *Ophiuroidea* (sand-stars and brittle-stars), *Crinoidea* (feather stars), *Cystoidea* (extinct), *Blastoidea* (extinct), and *Holothuroidea* (sea-cucumbers). All are marine. Also *Echinodermata*.

The organization of the *Echinodermata* does in fact appear so different from that of the coelenterates, and seems to belong to a so much higher grade of development, that the combination of the two groups as *Radiata* is inadmissible, and so much the more so since the radial arrangement of the structure exhibits some transitions towards a bilateral symmetry. The *Echinodermata* are separated from the Coelenterata by the possession of a separate alimentary canal and vascular system, and also by a number of peculiar features both of organization and of development. *Claus, Zoology* (trans.), I. 267.

echinodermatous (e-kī-nō-dēr-mā-tus), *a.* [< NL. *echinodermatus*, < Gr. *ἐχίνο*, a hedgehog, sea-urchin, + *δέρμα*(τ-), skin.] Having a spiculate or indurated skin; specifically, of or pertaining to the echinoderms or *Echinodermata*. Also *echinodermul*.

Having the form or appearance of a sea-urchin: in entomology, applied to certain insect-eggs which are shaped like an echinus, and covered with crowded deep pits.—2. Pertaining to the *Echinoidea*.

II. *n.* In *zool.*, one of the *Echinoidea*.

The spheroidal *echinoids*, in reality, depart further from the general plan and from the embryonic form than the elongated spatangoids do. *Huxley, Lay Sermons*, p. 223.

Echinoidea (e-kī-nō'idē-ā), *n. pl.* [NL., < *Echinus* + *-oidea*.] A class of the phylum or subkingdom *Echinodermata*; the sea-urchins or sea-eggs. They have a rounded, depressed (not elongated) form, subspherical, cordiform, or discoid, inclosed in a test or shell composed of many calcareous plates closely and usually immovably connected, studded with tubercles and bearing movable spines, and perforated in some places for the emission of tube-feet; an oral and anal orifice always present, a convoluted intestine, a water-vascular system, a blood-vascular system, and sometimes respiratory as well as ambulatory appendages. The perforated plates are the ambulacra, alternating with imperforate interambulacral plates; there are usually five pairs of each. The anus is dorsal or superior, the mouth ventral or inferior; the latter in many forms has a complicated internal skeleton. The general arrangement of parts is radiate or actinomorphic, with meridional divisions of parts; but bilaterality is recognizable in many adults, and perfectly expressed in the larval forms. The *Echinoidea* are divisible into *Regularia*, *Desmoticia*, or *Endocyclia*, containing the ordinary symmetrically globose forms, as *Cidaris*, *Echinus*, and *Echinometra*; and the *Irregularia*, *Petalosticta*, or *Exocyclia*, containing the cake-urchins and heart-urchins, or the clypeastroids and spatangoids (respectively sometimes erected into the orders *Clypeastrida* and *Spatangida*); together with the Paleozoic echinoids, which in some systems constitute a third order, *Palaeochinoidea*. Also *Echinoidea*.

Diagram of Echinopædia, much enlarged.

A, common primitive form of *Echinodermata*, whence *B, B'*, a vermiform holothurid, and *C, C'*, a platiform ophiurid or echinid (plateus) larva are derived: *a*, mouth; *b*, stomach; *c*, intestine; *d*, anus; *e*, ciliated band.

given by Huxley to the primitive generalized type-form of the *Echinodermata*, illustrated by the bilaterally symmetrical embryonic stage of nearly all members of that class. See the extract.

In many Echinoderms, the radial symmetry, even in the adult, is more apparent than real, inasmuch as a median plane can be found, the parts on each side of which are disposed symmetrically in relation to that plane. With a few exceptions, the embryo leaves the egg as a bilaterally symmetrical larva, provided with ciliated bands, and otherwise similar to a worm-larva, which may be termed an *Echinopædium*. The conversion of the *Echinopædium* into an Echinoderm is effected by the development of an enterocæle, and its conversion into the peritoneal cavity and the ambulacral system of veins and nerves, and by the metamorphosis of the mesoderm into radially-disposed antimeres, the result of which is the more or less complete obliteration of the primitive bilateral symmetry of the animal.

Huxley, *Anat. Invert.*, p. 466.

=*Syn. Echinopædium*, *Pluteus*. *Echinopædium* is the more general term, used by its proposer to cover any embryonic or larval stage of any echinoderm from the gastrula stage to the assumption of its specific characters. A *pluteus* is a special platiform larva of some echinoderms, as the holothurians, ophiurians, and echinids proper.

resemblance to the *Asterida*. The genera *Echinothuria*, *Calveria*, and *Phormosoma* are examples.

Echinothuriidæ (e-kī-nō-thū'ri-i-dē), *n. pl.*

Fragment of a Fossil Echinus (*Echinothuria floriss*).

G. igel = MLG. I. G. egel = Icel. igull, a hedgehog.*] 1. A hedgehog. 2. A sea-urchin.

3. [*cap.*] [*N.L.*] A Linnæan genus (1735), formerly used with great latitude, now the typical genus of the family *Echinidæ*, containing such sea-urchins or sea-eggs as *E. sphaera*, the common British species, or the Mediterranean *E. esculentus*, which is extensively used for food, the ovaries being eaten. The genus may be taken to exemplify not only the family to which it pertains, but the whole order of regular sea-eggs, and the class of sea-urchins itself. The shape is depressed globose, with centric mouth and anus; the shell or test is hard, immovable, meridionally divided into five pairs of imperforate alternating with five pairs of perforate plates, the plates studded with tubercles, and in life bearing movable spines. The perforate plates are the ambulacra, emitting the tube-feet. The mouth has a complicated system of plates, constituting the object known, when detached, as *Aristotle's lantern* (which see, under *larynx*). A sea-urchin is comparable to a starfish with the five arms bent upward and their ends brought together in the center over the back of the animal, and then soldered together throughout, with the modification of internal structure which such an arrangement of the parts would necessarily entail.

4. In arch., the convex projecting molding of eccentric curve in Greek examples, supporting the abacus of the Doric capital; hence, the

corresponding feature in capitals of other orders, or any molding of similar profile to the Doric echinus. Such moldings are often sculptured or painted with the egg-and-dart ornament.

In this instance the abacus is separated from the shaft; there is a bold *echinus* and a beaded necking; in fact, all the members of the Grecian order, only wanting the elegance which the Greeks added to it.

Called *Toxica* by Gray.

Echitonium (ek-i-tō'ni-um), *n.* [NL., < *L. echite*, a kind of elematis; or < *L. echitis*, Gr. *ἔχιν*, a kind of stone; < Gr. *ἔχιν*, an adder, viper: see *Echis*.] A genus of fossil plants, instituted by Unger. The genus is planerogamous, and is said by Schimper to be analogous to *Echites* of Linnaeus, an intertropical boraginaceous genus of plants occurring in Asia and America. They are found in various localities in central Europe in the Tertiary.

Echium (ek'i-um), *n.* [NL., < Gr. *ἔχιν*, a plant (*Echium rubrum*), < *ἔχιν*, a viper: see *Echis*.] A genus of boraginaceous plants, tall hairy herbs or somewhat shrubby, natives of the old world. There are about 50 species, chiefly of the Mediterranean region and South Africa, of which the common viper-bugloss, or blueweed, *E. vulgare*, with showy blue flowers, has become naturalized in some parts of the United States.

The group contains the families *Echiuridae* and *Sternaspidae*, and is equivalent to a gephyrean order *Chaetifera*.

The *Echiuroidea* or chaetiferous gephyrea present no external segmentation of their elongated and contractile body; they have, however, in the young state, the rudiments of 15 metameres. *Claus*, *Zoology* (trans.), I. 389.

Echiurus (ek-i-ū'rus), *n.* [NL. (for **Echidurus*), < Gr. *ἔχιν* (*ἔχιν*), an adder, viper, + *οὐρά*, a tail.] A genus of chaetiferous gephyreans (one of the group *Chaetifera*) of (Hegenbaur), armed with two strong setae on the ventral side (whence the name). The cuticle develops chitinous processes, and there is a communication between the rectum and the perivisceral cavity by means of a pair of tubular organs which are ciliated internally and at their apertures. It is the typical genus of the family *Echiuridae*. *E. pallasi* of the North Sea is an example. Also written *Echituris*.

Echiurus Gaertneri, about natural size.

echlorophyllose (ē-klo-rō-fil'ōs), *a.* [*Echlophyllosus*, < *L. e-* priv. + *chlorophyllum*, chlorophyl: see *chlorophyl*, *chlorophyllous*.] Without chlorophyl. *Braithwaite*.

echo (ek'ō), *n.*; *pl. echoes* (-ōz). [Altered (after *L.*) from earlier spelling; early mod. *E.* also *echoc*, *echo*; < ME. *eccho*, *ekko* = D. G. *echo* = Dan. *echo*, *ekko* = Sw. *eko* = OF. *ego*, F. *écho* = Sp. *eco* = Pg. *eco*, *eco* = It. *eco*, < *L. echo* (ML. also *eccho*), < Gr. *ἠχώ*, a sound, an echo; cf. *ἠχολογία*, a sound, noise, *ἠχιν*, sound, ring, etc.] *1.* A sound repeated by reflection or reverberation from some obstructing surface: sound heard again at its source; repercussion of sound: as, an *echo* from a distant hill. Sound being produced by waves or pulses of the air, when such waves meet an opposing surface, as a wall, they are reflected like light-waves (see *reflection*); the sound so heard, as if originating behind the reflecting surface, is an *echo*. The *echo* of a sound returns to the point whence the sound originated if the reflecting surface is at right angles to a line drawn to it from that point. An oblique surface reflects the sound in another direction, so that it may be heard elsewhere, though not at the point

where the sound originated. If the direct and reflected sounds succeed one another with great rapidity, which happens when the reflecting surface is near, the *echo* only clouds the original sound, but is not heard distinctly; and it is such indistinct echoes that interfere with the hearing in churches and other large buildings. An interval of about one ninth of a second is necessary to discriminate two successive sounds; and as sound passes through the atmosphere at the rate of about 1,125 feet in a second, $\frac{1}{9}$ of 1,125, or about 62 feet, will be the least distance at which an *echo* can be heard; and this will be distinct only in the case of a sharp, sudden sound. The walls of a house or the ramparts of a city, the surface of a cloud, a wood, rocks, mountains, and valleys produce echoes. Some echoes are remarkable for their frequency of repetition, and are called *multiple* or *tautological* echoes.

Folweth *Ekko*, that holdeth no silence,
But ever answereth at the countertail.
Chaucer, Clerk's Tale, l. 1182.

The babbling *echo* mocks the hounds,
Replying shrilly to the well-tun'd horns,
As if a double hunt were heard at once.
Shak., Tit. And., II. 3.

The Scriptures are God's voice; the church is his *echo*, a redoubling, a repeating of some particular syllables and accents of the same voice. *Donne*, Sermons, xiv.

Blow, bungle, blow, set the wild *echoes* flying,
And answer, *echoes*, answer, dying, dying, dying.
Tennyson, Princess, III. (song).

2. [cap.] In classical myth., an oread or mountain nymph, who, according to a usual form of the myth, pined away for love of the beautiful youth Narcissus till nothing remained of her but her voice.

Within thy airy shell.
Milton, Comus, l. 230.

3. Figuratively, a repetition of the sentiments of others; reproduction of the ideas or opinions of others, either in speech or in writing.

It is the folly of too many to mistake the *echo* of a London coffeehouse for the voice of the kingdom.
Swift, Conduct of the Allies.

4. In music, the very soft repetition of a short phrase, particularly in orchestral or organ music. In large organs an *echo*-organ is sometimes provided for *echo-like* effects; it consists of pipes shut up in a tight box, or removed to a distance from the organ proper, and controlled by a separate keyboard or by separate stops. A single stop so used or placed is called an *echo stop*.

5. In arch., a wall or vault, etc., having the property of reflecting sound or of producing an *echo*. — *6.* [cap.] [NL.] In zool., a genus of neuropterous insects. *Selys*, 1853. — *7.* In whist-playing, a response to a partner's signal for trumps. — *To the echo*, so as to produce a reverberation of sound; hence, loudly; vehemently; so as to excite attention and response: chiefly used with *applaud* or similar words.

I would applaud thee to the very *echo*,
That would applaud again.
Shak., Macbeth, v. 3.

echo (ek'ō), *v.* [*Echo*, *n.*] *I. intrans.* *1.* To emit an *echo*; reflect or repeat sound; give forth an answering sound by or as if by *echo*.

How often from the steep
Of *echoing* hill or thicket have we heard
Celestial voices.
Milton, P. L., iv. 681.

2. To be reflected or repeated by or as if by *echo*; return or be conveyed to the ear in repetition; pass along by reverberation.

Her mitred princes hear the *echoing* noise,
And, Albion, dread thy wrath and awful voice.
Sir R. Blackmore.

Sounds which *echo* further west
Than your sires' "Islands of the Blest."
Byron, Don Juan, III. 86.

Drums and trumpets *echo* loudly,
Wave the crimson banners proudly.
Longfellow, The Black Knight (trans.).

II. trans. *1.* To emit an *echo* of; reflect the sound of, either directly or obliquely; cause to be heard by reverberation: as, the whispering gallery of St. Paul's in London *echoes* very faint sounds.

Never [more shall] the black and dripping precipices
Echo her stormy scream as she sails by.
M. Arnold, Sohrab and Rustum.

2. To repeat as if by way of *echo*; emit a reproduction of, as sounds, words, or sentiments; imitate the sound or significance of.

Then gan triumphant Trompets sound on hie,
That sent to heaven the *echoed* report
Of their new joy, and happy victory.

Those peals are *echoed* by the Trojan throng.
Dryden, Æneid.

The whole nation was *echoing* his verse, and crowded theatres were applauding his wit and humour.

I. D'Iseroli, Calam. of Authors, I. 159.

They would have *echoed* the praises of the men whom they envied, and then have sent to the newspapers libels upon them. *Macaulay*.

3. To imitate as an *echo*; repeat or reproduce the sounds, utterances, or sentiments of: as, the mocking-bird *echoes* nearly all other creatures; to *echo* a popular author.

And the true art for . . . popular display is — to contrive the best forms for appearing to say something new, when in reality you are but *echoing* yourself.

De Quincey, Style, I.

echoer (ek'ō-ēr), *n.* One who echoes.

W. Howitt, Visits to Remarkable Places (Amer. ed., 1842), p. 181.

echoic (ek'ō-ik), *a.* [= Sp. *ecólico* = Pg. *echoico*, < *L. echoicus*, echoing, riming (of verses), < *L. echo*, *echo*: see *echo*.] Pertaining to or formed by *echoism*; onomatopoeitic. See extract under *echoism*.

An *echoical* verse, wherein the sound of the last syllable doth agree with the last save one, as in an *echo*.

Nonneciator.

echoism (ek'ō-izm), *n.* [*Echo* + *-ism*.] In philol., the formation of words by the echoing or imitation of natural sounds, as those caused by the motion of objects, as *buzz*, *whizz*, or the characteristic cries of animals, as *cuckoo*, *chickadee*, *whip-poor-will*, etc.; onomatopoeia. [Recent.]

Onomatopoeia, in addition to its awkwardness, has neither associative nor etymological application to words imitating sounds. It means word-making or word-coining, and is as strictly applicable to Comte's *altruisme* as to *cuckoo*. *Echoism* suggests the echoing of a sound heard, and has the useful derivatives *echoist*, *echoize*, and *echoic*, instead of *onomatopoeitic*, which is not only unmanageable, but, when applied to words like *cuckoo*, *crack*, *erroneous*; it is the voice of the cuckoo, the sharp sound of breaking, which is onomatopoeitic or word-creating, not the *echoic* words which they create.

J. A. H. Murray, 9th Ann. Address to Philol. Soc.

echoist (ek'ō-ist), *n.* [*Echo* + *-ist*.] One who forms words by the imitation or echoing of sounds. See *echoism*. [Recent.]

echoize (ek'ō-iz), *v. i.*; pret. and pp. *echoized*, ppr. *echoizing*. [*Echo* + *-ize*.] To form words by echoing or imitating sounds. See *echoism*. [Recent.]

echoscope (ek'ō-skōp), *n.* [*Echō*, < Gr. *ἠχώ*, sound, *echo*, + *σκοπεῖν*, view.] A stethoscope.

echo-stop (ek'ō-stop), *n.* See *echo*, 4.

Echymys, *n.* An erroneous form of *Echimus*. *Wiegmann*, 1838.

foraging or *army ants*, usually placed in the family *Myrmicidae*, as the petiole of the abdomen has two nodes. It is now supposed that the genus *Labidus*, of the family *Dorylidae*, is represented exclusively by the males of *Eciton*, and the characters of both groups require revision. These ants are found in South and Central America, and 3 species of *Eciton* and 6 of *Labidus* are known in the United States, from Utah, New Mexico, California, and Texas. There are two kinds of neuters or workers, large-headed and small-headed, the former of which are called *soldiers*. They are carnivorous, march in vast numbers, and are very destructive.

When not creative, their genius has been *eclectic* and refining. Steadman, Vict. Poets, p. 23.

Eclectic medicine, a medical theory and practice based upon selection of what is esteemed best in all systems; specifically, the medical system of a separately organized school of physicians in the United States, who make much

use of what they regard as specific remedies, largely or chiefly botanical.—**Eclectic physician**. (a) One of an ancient order of physicians, supposed to have been founded by Agathinus of Sparta. (b) A practitioner of the American school of eclectic medicine.

II. n. One who, in whatever department of knowledge, not being convinced of the fundamental principles of any existing system, culls from the teachings of different schools such doctrines as seem to him probably true, conformable to good sense, wholesome in practice, or recommended by other secondary considerations; one who holds that opposing schools are right in their distinctive doctrines, wrong only in their opposition to one another. In philosophy the chief groups of eclectics have been—(1) those ancient writers, from the first century before Christ, who, like Cicero, influenced by Platonic skepticism, held a composite doctrine of ethics, logic, etc., aggregated of Platonist, Peripatetic, Stoic, and even Epicurean elements; (2) writers in the seventeenth century who, like Leibnitz, mingled Aristotelian and Cartesian principles; (3) writers in the eighteenth century who adopted in part the views of Leibnitz, in part those of Locke; (4) Schelling and others, who held beliefs derived from various idealistic, pantheistic, and mystical philosophies; (5) the school of Cousin, who took a mean position between a philosophy of experience and one of absolute reason.

Even the *eclectics*, who arose about the age of Augustus, . . . were . . . as slavish and dependent as any of their brethren, since they sought for truth not in nature, but in the several schools. Hume, Rise of Arts and Sciences.

My notion of an *eclectic* is a man who, without foregoing conclusions of any sort, deliberately surveys all accessible modes of thought, and chooses from each his own "hortus siccus" of definitive convictions. J. Owen, Evenings with Skeptics, II. 321.

Sensualism, idealism, skepticism, mysticism, are all partial and exclusive views of the elements of intelligence. But each is false only as it is incomplete. They are all true in what they affirm, all erroneous in what they deny. Though hitherto opposed, they are, consequently, not incapable of coalition; and, in fact, can only obtain their consummation in a powerful *eclecticism*—a system which shall comprehend them all. Sir W. Hamilton, Edinburgh Rev., I. 201.

eclectism (ek-lek'tizm), *n.* [< F. *éclectisme* = Pg. *eclectismo*, < Gr. *ἐκλεκτός*, picked out: see *eclectie* and *-ism*.] Same as *eclecticism*. [Rare.]

In *astron.*, an interception or obscuration of the light of the sun, moon, or other heavenly body, by the intervention of another heavenly body either between it and the eye or between it and the source of its illumination.

An eclipse of the sun is caused by the intervention of the moon between it and the earth, the sun's disk being thus partially or entirely hidden, an eclipse of the moon is occasioned by the earth passing between it and the sun the earth's shadow obscuring the whole or part of its surface, but never entirely concealing it. The number of eclipses of the sun and moon cannot be fewer than two nor more than seven in one year, exclusive of penumbral eclipses of the moon. The most usual number is four, seven being very rare. Jupiter's satellites are eclipsed by passing through his shadow. See *occultation*.

To obscure by an eclipse; cause the obscuration of; darken or hide, as a heavenly body: as, the moon *eclipses* the sun.

2. To overshadow; throw in the shade; obscure; hence, to surpass or excel.

II. n. 1. In *astron.*, a great circle of the heavens in the plane of the earth's orbit, or that of the apparent annual motion of the sun among the stars. The *fixed ecliptic* is the position of the ecliptic at any given date. The *mean ecliptic* is the position of the fixed ecliptic relative to the equinoctial, as modified by precession. This is now approaching the equinoctial at the rate of 47" per century. The *true or apparent ecliptic* is the mean ecliptic as modified by the effects of nutation. The *obliquity of the ecliptic* is the inclination of the

ecliptic to the equinoctial. Its mean value for A. D. 1900 is 23° 27' 8".

His own, tho' keen and bold and soldierly,
Sear'd by the close ecliptic, was not fair.
Tennyson, Aymer's Field.

2. A great circle drawn upon a terrestrial globe, tangent to the tropics. It is sometimes said to "mark the sun's annual path across the surface of the earth"; but since its plane is represented as fixed upon the earth, the rotation of the latter will give it a gyratory motion incompatible with its representing any celestial appearance. It may, however, prove convenient when a terrestrial globe is used instead of a celestial one.

eclogue, *n.* An abbreviated spelling of *eclogue*.

eclogite (ek'log-jit), *n.* [*Gr. ἔκλογος*, picked out (*ἐκ* *ἐκλέγω*, pick out, choose), + *-ite*.] The name given by Haüy to a rock consisting of a crystalline-granular aggregate of omphacite (a granular, grass-green variety of pyroxene) with red garnet. With these essential constituents cyanite (disthene) is often associated, and, less commonly, silvery mica, quartz, and pyrites. This is one of the most beautiful of rocks, and of rather rare occurrence. It is found in the Alps, in the Fichtelgebirge in Bavaria, in the Erzgebirge in Bohemia, and also in Norway. It occurs in lenticular masses in the older gneisses and schists. To the variety occurring at Syria in Greece, consisting largely of cyanite or disthene, the name *epanite rock* or *disthene rock* has been given. Also spelled *eclogite*.

Each zooid is accordingly surrounded by a very regular and symmetrical case—the *ectocyst* or cell; through the opening of which the anterior part of the soft body of the contained zooid with its tentacular crown can be protruded. *Claus*, *Zoology* (trans.), II. 71.

ectolothal (ek-tō-les'i-thal), *a.* [< Gr. *ἐκτός*, outside, + *λόθος*, yolk, + *-al*.] In *embryol.*, noting those ova which have the food-yolk peripheral in position, and thus exterior to the formative yolk. The cleavage or segmentation is consequently confined at first to the inner parts of the ovum, and it is only in later stages, when the food-yolk has shifted to the center, that the cleavage becomes peripheral. The egg of the spider is an example. See *entolothal*, *telolothal*.

The first processes of segmentation in these at first *ectolothal* ova are withdrawn from observation, since they take place in the centre of an egg covered by a superficial layer of food-yolk.

They have short tarsi feathered part way down in front, a short bill feathered far forward, the wings acutely pointed by the first three

primaries, a long cuneate tail of 12 tapering acuminate feathers, wing-coverts with black spots, partly-colored tail-feathers, an iridescent neck, and the sexes distinguishable by color. *E. migratorius* is the common wild pigeon or passenger-pigeon of North America. In the *Ectoprocta*, . . . the endocyst consists of two layers, an outer and inner; of which the former is the representative of the ectoderm in other animals. The latter lines the walls of the perivisceral cavity, and is reflected thence, like a peritoneal tunic, over the tentacular sheath and into the interior of the tentacula, whence it is continued on to the alimentary canal, of which it forms the external investment. The endoderm, which lines the alimentary canal, is of course continuous, through the oral opening, with the ectoderm.

Huxley, Anat. Invert., p. 571.

ectoproctous (ek-tō-prok'tus), *a.* [< NL. *ectoproctus*, < Gr. *ἐκτός*, outside, + *πρωκτός*, the anus, posterior.] Pertaining to or having the characters of the *Ectoprocta*: specifically applied to those *polyzoans*, as the *Gymnolamata*, which have the anus situated outside the circle of tentacles: opposed to *endoproctous*.

The regular formative of the preterit or past tense, and the perfect participle, respectively, of English "weak" verbs: suffixes of different origin (see etymology), but now identical in form and phonetic relations, and so conveniently treated together. Either suffix is attached (with suppression of final silent *-e*, if any) to the infinitive or first person indicative, and varies in pronunciation and spelling according to the preceding consonant (the final consonant of the infinitive): (1) *-ed*, pronounced *ed* after *t, d*, as in *heated, loaded, etc.*, and archaically in other positions, as in *halloved, raised, etc.*, and usually in some perfect participles used adjectively, as in *blessed, crooked, winged, etc.*, parallel to *blest, crooked* (pronounced *krūkt*), *winged* (pronounced *wīngd*), etc. (2) *-ed*, pronounced (with suppression of the vowel) *d*, after a sonant, namely, *b, g, "hard," g "soft" (-ge = dzh or zh), j* (written *-ge*, as preceding), *s (-se = z), th (as dh), v, z, l, m, n, ng, r*, as in *robbed, robbed, engaged, engaged, rouged, hedged, raised, posed, smoothed, breathed, lived, buzzed, boiled, felled, beamed, dreamed, stoned, learned, hanged, barred, abhorred, etc.* (but after the liquids *l, m, n, r*, in some words also or only *-t*: see below), or after a vowel, or a vowel before *h* or *v*, as in *hoed, rused, brayed, loved,aved, hurrahed, etc.*—most words of this class being formerly written without the vowel, which subsequently came to be indicated, pedantically, by an apostrophe, as in *rais'd, breath'd, ite'd*, etc. (this device being still retained by some, for its apparent metrical value, in verse, but otherwise little used in verbs, though it is the rule in the analogous instances of the possessive case of nouns, as in *man's, boy's*, etc.), except in a few words which have preserved the simple form, namely, (3) *-d*, pronounced *d* (the vowel being suppressed in both pronunciation and spelling), as in *laid, paid, staid, shod, heard, sold, told*, and (with loss of the final consonant of the infinitive) *clad, had, and made* (so spelled to preserve the "long" vowel), and, in preterit only, *ould, should, would*—these forms being "irregular" in spelling only (*laid, paid, staid*), or in spelling and pronunciation, as compared with the forms having the usual

-ed (4) **-ed**, pronounced *t* (the vowel being suppressed and the *d* assimilated to the preceding consonant) after a surd, namely, *e* "soft" (= *e*), *ch* (= *ts*), *f*, *k*, *p*, *qu* (= *k*), *s* surd, *sh*, *th* surd, *x* (= *ks*), as in *facied*, *enticed*, *matched*, *cuffed*, *coughed* (pronounced *kóft*), *looked*, *lacked*, *typed*, *figured*, *pressed*, *clawed*, *clashed*, *toothed*, *earthed*, *mixed*, etc., such words being formerly, as a rule, and still optionally (in verse, as preferred by Tennyson and other modern poets, or in restored or reformed spelling), spelled as pronounced, with *t*, as *lookt*, *lackt*, *typet*, *figurt*, *presset*, etc.; in some words, where *-ed* after a liquid, *l*, *m*, *n*, *r*, or a vowel, is pronounced *t* instead of *d*, as regularly, *d*, and in some words after *p*, the spelling *-t* prevails, either exclusively (and then accompanied by a change of the radical vowel), as in *dralt*, *falt*, *brought*, *caught*, *thought*, *wrought*, *brought*, *sought*, *taught*, *slept*, *swept*, *wept*, etc., or with a parallel form in *-ed* pronounced *d*, as in *spelt*, *spilt*, *spoilt*, *dreamt*, *leant*, *pent*, *burnt*, etc. (the *t* in some cases absorbing the final *d* of the infinitive, as in *bent*, *blent*, *built*, *girt*, etc.), with parallel forms *spelled*, *spilled*, etc. (*beruled*, *girded*, etc.). (5) In some monosyllables the suffix *-ed*, reduced to *-d* or *-t*, as above, has blended with the final *-d* or *-t* of the infinitive, forming, in earlier spelling, a double consonant, *dd* or *tt*, which has since been simplified, as in *shed*, *shred*, *hit*, *spit*, etc., all trace of the suffix being thus effaced, and such preterites and past participles being assimilated to the infinitive; an original long vowel in the infinitive becoming short in the preterit and past participle, as in *read*, preterit and past participle *read* (*red*), *lead*, preterit and past participle *led* (where the change is recognized in the spelling), and hence, rarely, in the infinitive, as in *spread*, preterit and past participle *spread*. Some words ending in *-ed* (participles used as adjectives) may, with the definite article, or other definitive word, preceding, come to be used as nouns, having as such a possessive case (in *'s*) and a plural (in *-s*): as, the police took charge of the *deceased's* effects; at this the *accused's* countenance changed. This is found chiefly in newspaper language; but the plural, as "*their beloveds*," is not uncommon in recent poetry. See *-d*, *-d²*, *-t*, *-t²*.

Edda (ed'ā), *n.* [Icel., lit. great-grandmother.] A book written (in prose) by Snorri Sturluson (born about 1178, died by assassination 1241), containing the old mythological lore of Scandinavia and the old artificial rules for verse-making; also, a collection of ancient Icelandic poems. The name *Edda*, by whom given is not known, occurs for the first time in the inscription to one of the manuscripts of the work, written fifty or sixty years after Snorri's death. Snorri's *Edda* (*Edda Snorra Sturlusonar*) consists of five parts: 1. *Formáli* (Preface), the *Gylfaginning* (Delusion of Gylfi), *Brage-rudhar* (Sayings of Bragi), *Skáldskapar-mál* (Art of Poetry), and *Haustatal* (Number of Meters), to which are added in some manuscripts *Thurur*, or a rhymed glossary of synonyms, lists of poets, etc. As the *Skáldskapar-mál*, or Art of Poetry, forms the chief part of the *Edda* (including several long poems), the work became a sort of handbook of poets, and so *Edda* came gradually to mean the old artificial poetry as opposed to the modern plain poetry contained in hymns and sacred poems. About the year 1643 the Icelandic bishop Brynjulf Sveinsson discovered a collection of the old mythological poems, which is erroneously ascribed to Saemund Sigfusson (born about 1055, died 1188) and hence called after him *Saemundar Edda hins Fróðka*, the *Edda* of Saemund the Learned. The poems that compose this *Edda* are supposed to have been collected about the middle of the thirteenth century, but were composed probably in the eighth and ninth centuries. Hence the name now given to the collection, the *Elder* or *Poetic Edda*, in distinction from the *Younger* or *Prose Edda* of Snorri, to which alone the name *Edda* previously belonged. The most ancient of the poems in the *Elder Edda* is the *Völuspá*, the Prophecy of the *Völva* or sibyl.

Cf. *eddish*.] A part of a fluid, as a stream of water, which has a rotatory motion; any small whirl or vortex in a fluid. Eddies are due to the viscosity of fluids, and to the very small degree to which they slip over the surfaces of solids. A portion of fluid to which a rotatory motion has once been communicated loses this motion only by the gradual effect of viscosity, so that eddies subsist for some time. They are always found between counter-currents.

Edentata (ē-den-tā'tā), *n. pl.* [NL., neut. pl. of *L. edentatus*, toothless: see *edentate*.] 1. In *mammal*, a Cuvierian order of mammals; the *edentates*. The term is literally incorrect, and in so far objectionable, few of these animals being edentulous or toothless: and the Linnean equivalent term, *Bruta*, is often employed instead. But the name is firmly established, and the members of the order do agree in certain dental characters, which are those: that incisors are never present, and that the teeth, when there are any, are homodont and (excepting in *Tatusiinae*) monophyodont, growing from persistent pulps, and being devoid of enamel.

Edentate Skull of Great Ant-eater (*Myrmecophaga jubata*).

The *Edentata* are ineducabilian placental mammals, with a relatively small cerebrum of one lobe, but otherwise very diversified in structure, appearance, and mode of life; the old-world forms are likewise wholly different from those of the new world; most edentates are of the latter. The armadillos, sloths, and ant-eaters of America, and the folioid ant-eaters and scaly ant-eaters of Africa and Asia, represent respectively five leading types of *Edentata*, affording a division of the order into the five suborders *Loricata* (armadillos), *Tardigrada* (sloths), *Vermilingua* (American ant-eaters), *Synamia* (scaly ant-eaters or pangolins), and *Podientia* (digging ant-eaters or aardvarks). The *Tardigrades*, including a number of gigantic fossil forms, as the mylodons and megatheriums, formerly called *Gravigrada*, are herbivorous, and the living forms are all arboreal. The others are carnivorous and chiefly insectivorous, and it is among these that the entirely toothless forms occur, as in the ant-eaters. The Cuvierian *Edentata* included the *Monotremata*, now long since eliminated.

Burns, *Wandering Willie*.

ee. A common English digraph, of Middle English origin, having now the sound of "long" *e*, namely, ē. In Middle English it was actually "double" *e* that is, the long sound a corresponding to the short sound *e*, representing an Anglo-Saxon long *e* (ē), as in *beet*, *greet*, *meet*, *breed*, *feed*, etc., or an Anglo-Saxon *æ*, as in *seed*, *eel*, *sleep*, *weed*, etc., or *ea*, as in *cheek*, *steep*, *look*, etc., or *ai*, as in *bea*, *dear*, *dear*, *creep*, *swed*, etc., such vowels or diphthongs becoming in later Middle English long *e*,

written either *e* or *ee*, and in early modern English spelled *ee* or *ea*, with some differentiation (see *ea*). In words of other than Anglo-Saxon origin *ee* has the same sound, except in a few words not completely Anglicized, as in *matinee*. Words of Oriental or other remote origin having the vowel *i* (pronounced ē) are often spelled with *ee* when turned into English form, as *elehee*, *sultee*, etc.

E. E. An abbreviation of *errors excepted*, a saving clause frequently placed at the foot of an account rendered. Also, in a fuller form, *E. and O. E.* (which see).

-ee¹. [Late ME. *-e* or *-ee*, < OF. *-e*, fem. *-ee*, mod. F. (with a diacritical accent) *-é*, fem. *-ée* (pron. alike), < L. *-atus*, fem. *-ata*, pp. of verbs in *-are*, F. *-er*. Early ME. *-e*, *-ee*, from the same source, has usually become thoroughly Englished as *-y*, or *-ey*; cf. *arm-y*, *jur-y*, *jell-y*, *chim-n-ey*, *jour-n-ey*, etc. See *-ate¹*, *-ade¹*, *-y*.] A suffix of French, or more remotely of Latin origin, ultimately the same as *-ate¹* and *-et²*, forming the termination of the perfect passive participle, and indicating the object of an action. It occurs chiefly in words derived from old Law French or formed according to the analogy of such words, as in *pay-er*, *draw-ee*, *assign-ee*, *employ-ee*, etc., denoting the person who is paid, drawn on, assigned to, employed, etc., as opposed to the agent in *-or¹* or *-er¹* (in legal use generally *-or¹*), as *pay-er* or *pay-or*, *draw-er*, *assign-or*, *employ-er*, etc.

-ee². [Cf. dim. *-ie*, *-y*, and see *-eel¹*.] A diminutive termination, occurring in *bootee*, *goatee*, etc. The diminutive force is less obvious in *settee*, which may be regarded as a diminutive of *settle*.

An elongated apodal fish of the family *Anguillidae* and genus *Anguilla*, of which there are several species. The body is very long and subcylindrical, covered with discrete minute elliptical scales, chiefly arranged diagonally to the axis and at right angles with one another, but immersed in the skin, and partly concealed by a slippery mucous coat. The head is somewhat depressed, and the lower jaw protuberant. The teeth are slender, conic, and crowded in small bands in both jaws and in a longitudinal band on the vomer. The dorsal, anal, and caudal fins are nearly uniform, and completely united into one, the dorsal beginning near the second third of the entire length of the body. The color is generally brownish or blackish, except on the belly, which is whitish or silvery. The females attain a considerably larger size than the males. The sexual organs are minute except in the breeding season, and sexual intercourse takes place in the sea. Young females ascend into fresh water, but the males remain in salt water, and have rarely been seen; and when full-grown the females return to the sea for sexual intercourse and spawning. Eels are of much economic importance, and objects of special fisheries. The common European species is *Anguilla anguilla* or *A. vulgaris*; the American is *A. rostrata*. See *Anguilla*, *Anguillidae*.

able fish, *Electrophorus* or *Gymnotus electricus*, of the family *Electrophoridae*, of a thick, eel-like form with a rounded, finless back, the vent at the throat, and the anal fin commencing behind it, of a brownish color above and whitish below. It has the power of giving strong electric discharges at will. The shocks produced are often violent, and serve as a means both of offense and of defense. They are weakened by frequent repetitions. Its electrical apparatus consists of two pairs of longitudinal bodies between the skin and the muscles of the caudal region, one pair next to the back and one along the anal fin. This apparatus is divided into about 240 cells, and is supplied by over 200 nerves. The electric eel is the most powerful of electric fishes. It sometimes attains a length of over 6 feet. It inhabits the fresh waters of Brazil and Guiana.—**Fug-nosed eel**, an eel of the genus *Simenohelys* (which see): so called by fishermen. It is a deep-sea species, found off the Newfoundland banks, often burrowing in the halibut, whence the specific name *S. parateticus*.—**Salt eel**. These baskets are usually attached to a framework of wood erected in a river, especially a tideway river, the large open end of each being opposed to the current of the stream. Chaucer, *Good Women*, l. 1169.

Effect of a machine, in *mech.*, the useful work performed in some interval of time of definite length. For *effect*, with the design of creating an impression; ostentatiously. *Hall effect*, the deflection within its conductor of an electric current passing through a magnetic field.

Peltier effect, the heating or cooling of a junction of dissimilar metals by the passage of an electric current. - **Thomson effect**, the evolution or absorption of heat by an electric current in flowing from one point in a conductor to another at a different temperature. - To *give effect to*, to make valid, carry out in practice; push to its legitimate or natural result. - To *take effect*, to operate or begin to operate. - **Syn.** 1. *Effect*, *Consequence*, *Result*; event, issue. *Effect* is the closest and strictest of these words, both philosophically and popularly representing the immediate product of a cause; as, every *effect* must have an adequate cause; the *effect* of a flash of lightning.

A *consequence* is, in the common use of the word, more remote, and not so closely linked to a cause as *effect*: it is that which follows. *Result* may be near or remote. It is often used in the singular to express the sum of the *effects* or *consequences*, viewed as making an end.

Find out the cause of this *effect*. *Shak.*, *Hamlet*, II. 2.

Consequences are unputyng. Our deeds carry their terrible *consequences*, quite apart from any fluctuations that went before - *consequences* that are hardly ever confined to ourselves.

Serving to effect the intended purpose; producing the intended or expected effect or result; operative; efficacious: as, an *effective* cause; *effective* proceedings.

Precision is the most *effective* test of affected style as distinct from genuine style. *A. Phelps*, Eng. Style, p. 115.

The rarity of the visits of *efficient* bees to this exotic plant [*Pinon Satiuum*] is, I believe, the chief cause of the varieties so seldom intercrossing.

That bears recovery's name. *Shak.*, Pericles, v. 1.

The act or state of flowing out or issuing in a stream; effusion; effluence; flow: as, an *efflux* of matter from an ulcer. The rate of efflux of a fluid is roughly calculated by Torricelli's theorem, that the velocity at the orifice is the same as if each particle had fallen freely from the level of the fluid in the vessel. But, owing to the converging motion, the area of the orifice is greater than the section of the stream, while the pressure is increased, so that the efflux is less than the amount given by Torricelli's theorem.

It is no wonder, if God can torment where we see no tormentor, and comfort where we behold no comforter; he can do it by immediate emanations from himself, by continual *effluxes* of those powers and virtues which he was pleased to implant in a weaker and fainter measure in created agents.

A voluntary action, not requiring such preparation, is, both in the terminology of psychology and in ordinary language, said to be performed without *effort*.

ited upon and in among the fibers of the egg-pod or putamen. It is a secretion of a particular calcific tract of the oviduct near the end of that tube. It may be nearly colorless and of such crystalline purity and translucency that the contents of the fresh egg show a pinkish bluish through it, or very heavy, opaque, flaky white; whole-colored of various tones, as green, blue, drab, ochrey, etc.; or partly-colored in many shades of reds, browns, etc., in endless variety of patterns. Besides the evident diversity of character in thickness, roughness, etc., the shell has many variations in microscopic texture, depending upon details of the deposition of the particles of lime in the pod. The shell of an ostrich's egg is so thick and hard that it may seriously wound a man if the egg explodes, as it sometimes does when added, in consequence of the compression of the gases generated in decomposition.—**Egg-shell china**, **egg-shell porcelain**, porcelain of extreme thinness and translucency. It was made originally in China, and is now produced also in European factories, where the process consists in filling a mold of plaster of Paris with the material called barbotine, of which a thin film at once adheres to the mold from the absorption of its moisture by the gypsum. ego (ē'gō), *n.* [*L. ego* = *Gr. ἐγώ* = *AS. ic*, *E. I*: see *I*.] The "I"; that which feels, acts, and thinks; any person's "self," considered as essentially the same in all persons. This use of the word was introduced by Descartes, and has long been current in general literature.

The *ego*, as the subject of thought and knowledge, is now commonly styled by philosophers simply the subject, and subjective is a familiar expression for what pertains to the mind or thinking power. In contrast and correlation to these, the terms object and objective are now in use to denote the non-ego, its affections and properties, and, in general, the really existent as opposed to the ideally known. *Sir W. Hamilton*.

For the *ego* without the non-ego is impossible in fact and meaningless in thought, and the abstraction of the *ego* from the bodily organisation and the intuition of itself by itself as a non-bodily entity is an artificial and deceptive process. *Mandeville, Body and Will*, p. 55.

Absolute ego. See *absolute*.—The empirical *ego*, the self as the object of itself; what "I" am conscious of as "myself."—The pure *ego*, the self regarded abstractly as the mere thinking subject, apart from every object of thought, even itself.

ego-altruistic (ē'gō-al-trū-is'tik), *a.* Relating or pertaining to one's self and to others. See the extract.

From the egotistic sentiments we pass now to the *ego-altruistic* sentiments. By this name I mean sentiments which, while implying self-gratification, also imply gratification in others; the representation of this gratification in others being a source of pleasure not intrinsically, but because of ulterior benefits to self which experience associates with it. *H. Spencer, Prin. of Psychol.*, § 519.

The Ideal, the True and Noble that was in them having faded out, and nothing now remaining but naked *egotism*, vulturous greediness, they cannot live. *Carlyle*.

2. In *ethics*, the doing or seeking of that which affords pleasure or advantage to one's self, in distinction to that which affords pleasure or advantage to others: opposed to *altruism*. In this sense the term does not necessarily imply anything reprehensible, and is not synonymous with *egotism*.

Egoism is the feeling which demands for self an increase of enjoyment and diminution of discomfort. Altruism is that which demands these results for others. *L. F. Ward, Dynam. Sociol.*, I. 14.

Egotism comprises the sum of inclinations that aim at purely personal gratification, each of these inclinations having its particular gratification; and the further we go back in civilisation, the greater is the predominance which these egoistic impulses have. *Mandeville, Body and Will*, p. 164.

3. In *metaph.*, the opinion that no matter exists and only one mind, that of the individual holding the opinion. The term is also applied (by critics) to forms of subjective idealism supposed logically to result in such an opinion. See *solipsism*. = *Syn.* 1. *Pride*, *Egotism*, etc. See *egotism*.

In *ethics*, pertaining or relating to one's self, and not to others; relating to the promotion of one's own well-being, or the gratification of one's own desires; characterized by egotism: opposed to *altruistic*.

Selfishness is only active *egotism*. *Lowell, Among my Books*, 1st ser., p. 364.

= *Syn.* *Pride*, *Egotism*, *Vanity*, *Conceit*, *Self-conceit*, *Self-consciousness*. *Pride* and *egotism* imply a certain indifference to the opinions of others concerning one's self. *Pride* is a self-contained satisfaction with the excellence of what one is or has, despising what others are or think. *Vanity* is just the opposite: it is the love of being even fulsomely admired. *Pride* rests often upon higher or intrinsic things: as, *pride* of family, place, or power; intellectual or spiritual *pride*. *Vanity* rests often upon lower and external things, as beauty, figure, dress, ornaments; but the essential difference is in the question of dependence upon others. Over the same things one person might have *pride* and another *vanity*. One may be too proud to be vain. *Conceit*, or *self-conceit*, is an overestimate of one's own abilities or accomplishments; it is too much an elevation of the real self to rest upon wealth, dress, or other external things. *Egotism* is a strong and obtrusive confidence in one's self, shown primarily in conversation, not only by frequent references to self, but by monopolizing

attention, ignoring the opinions of others, etc. It differs from conceit chiefly in its selfishness and unconsciousness of its appearance in the eyes of others. Conceit becomes egotism when it is selfish enough to disparage others for its own comparative elevation. Self-consciousness is often confounded with egotism, conceit, or vanity, but it may be only an embarrassing sense of one's own personality, an inability to refrain from thinking how one appears to others; it therefore often makes one shrink out of notice.

Vanity makes men ridiculous, pride odious. Steele. Pride, indeed, pervaded the whole man, was written in the harsh, rigid lines of his face, was marked by the way in which he stood, and, above all, in which he bowed. Macaulay, William Pitt.

His excessive egotism, which filled all objects with himself. Hazlitt.

We never could very clearly understand how it is that egotism, so unpopular in conversation, should be so popular in writing. Macaulay, Moore's Byron.

Something which befalls you may seem a great misfortune;—you . . . begin to think that it is a chastisement, or a warning. . . . But give up this egotistic indulgence of your fancy; examine a little what misfortunes, greater a thousand fold, are happening, every second, to twenty times worthier persons; and your self-consciousness will change into pity and humility. Ruskin, Ethics of the Dust, v.

See II., 2.—**Egyptian architecture**, the architecture of ancient Egypt, which, among its peculiar monuments, exhibits pyramids, rock-cut temples and tombs, and gigantic monolithic obelisks. The characteristic features of the style are solidity and the majesty attending colossal size. This is especially noticeable in the pylons or monumental gateways standing singly or in series before its temples. (b) Roofs and

covered ways, flat, and composed of immense blocks of stone, reaching from one wall or stone epistyle beam to another, the arch, although in all its forms of frequent use in domes and similar works, not being employed in architecture above ground, which holds consistently to the system of *intel-construction*. (c) Columns, numerous, close, and massive, without bases, or with broad, flat, low bases, and exhibiting great variety in their capitals, from a simple square block to a wide spreading bell, elaborately carved with palm-leaves or other forms suggested by vegetation, especially in some adaptation of the lotus plant, bud, or flower. (d) The employment of a large concave molding to crown the entablature, decorated with vertical flutings or leaves. (e) Walls and columns decorated with a profusion of sculptures in incised outline, often of admirable precision (see *cara ritico*), or in low relief, representing divinities, men, and animals, with innumerable hieroglyphs, brilliant and true, though simple coloring being superadded. A remarkable feature of Egyptian architecture is the grandeur of its mechanical operations, as in cutting, polishing, sculpturing, and transporting enormous blocks of limestone and of granite, and in its stupendous excavations in the solid rock. The prototype of the Greek Doric order is to be sought in such Egyptian columnar structures as the grotto-facades of Beni-Hassan; and from the Egyptian lotus carvings and decoration were developed many characteristic Assyrian decorative motives, as well as the Ionic capital and the graceful anthemion-molding of Greece. See *manabih*, *obelisk*, *pylon*, *pyramid*, *syrtis*, 2, etc.—**Egyptian art**, the architecture, sculpture, and painting of ancient Egypt, one of the most important of the great artistic developments of the world. (See *Egyptian architecture*, above.) The earliest known

Egyptian sculptures, not less than 6,000 years old, exhibit great technical skill, approach nature with remarkable ease and certainty, and far surpass in naturalness the more conventional works which succeeded them. Yet the best Egyptian works of all times possess striking individuality as well as refinement, a very large proportion

of the vast number of portrait statues and reliefs being evidently likenesses, and the physical differences of class, station, and employment, as well as ethnological differences in the countless historical scenes, being clearly rendered. With the advent of the Ptolemies, Greek influences were brought to bear upon Egyptian art, which progressively lost its good qualities without acquiring those of the art of Greece and of Rome. The great Sphinx of Ghizeh is the oldest as well as the largest work of sculpture known; the colossal of Amenhotep (Amenhotep) III. at Thebes (one of them is the famous Memnon, so called) are about 52 feet high; those of the Ramesses are of the same height; and that of Tanis is nearly 60 feet high. Egyptian painting is strictly illumination, as the colors are laid on flat, without shading or gradation, within a definite outline. The drawing is typically of great beauty, the outlines being firm, accurate, and graceful. In gem-cutting and jewelry, in enamel, in terra-cotta and glass, in the carving of wood and ivory, in metal-working, and in the industrial arts generally, Egyptian artists and artisans displayed great taste and skill, and were enabled by the diffusion of material prosperity to devise and perfect their products in endless diversity. — **Egyptian bean.** See *bean*. — **Egyptian black ware,** a name given by Wedgwood to one of his varieties of fine earthenware; same as *basalt ware* (which see, under *basalt*). — **Egyptian blue.** See *blue*. — **Egyptian chlorosis.** See *chlorosis*. — **Egyptian cloth.** Same as *mummy-cloth*. — **Egyptian darkness,** deep or total darkness: in allusion to the ninth plague of Egypt (Ex. x. 21-23). — **Egyptian frog,** a toad. *Hall's*. — **Egyptian herring.** See *herring*. — **Egyptian lotus.** See *lotus*. — **Egyptian pebble,** a species of agate or jasper. — **Egyptian pebbleware.** See *pebbleware*. — **Egyptian porcelain,** the name given to a ceramic ware of a blue or greenish color, made in the form of small mummy-shaped figures, and, more rarely, of figures of divinities, and cups, goblets, and the like, found in ancient Egyptian tombs. The material seems to have been sand held together by a relatively small amount of potter's clay; this, when fired, turns to an opaque glass or enamel throughout its whole mass. The color is an oxide of copper, which is applied to the surface, and stains the ware very deeply. — **Egyptian vulture.** See *vulture*. — **Egyptian ware,** a variety of Wedgwood ware.

The commercial down is chiefly obtained from the common eider, and is used in the manufacture of many beautiful fabrics, as coverlets, robes, tippets, muffs, etc. It is one of the very poorest conductors of heat, as well as an extremely light substance, thus preserving great warmth with very little weight.

redder, and dusker shades in small patterns. The down with which these birds line their nests is copious, and is much valued for its extreme lightness, warmth, and elasticity. The birds are practically domesticated in some places. The American bird, a slightly different variety from the European, is known as variety *dresseri*; it breeds abundantly in Labrador, Newfoundland, etc. The king eider-duck is a very distinct species, *Somateria (Frionetta) spectabilis*, the gibbosity of the bill being different in shape, and the head tinged with blue as well as green. The Pacific eider-duck is *S. o-nigrum*, having a black V-shaped mark on the chin, but otherwise resembling the common eider. The spectacled eider-duck, *Somateria (Arctonetta) fischeri*, inhabits the northern Pacific; its bill is not gibbous, and

it has no frontal processes, the feathers reaching beyond the nostrils. Steller's duck, *Heniconetta stelleri*, is often called *Steller's eider*, and sometimes included in the genus *Somateria*. See *Somateria*.

congress of bards and minstrels held periodically in Wales. The *eisteddfod* is a very ancient institution, but its modern form dates from about the twelfth century. It is designed to foster patriotism, to encourage the study of the Welsh language and literature, and to promote the cultivation of the ancient bardic poetry and music of the principality. Since 1819 an *eisteddfod* has been held almost every year. It usually attracts thousands of persons from all parts of the country, and lasts three or four days, which are devoted to orations and contests in poetry, singing, harping, etc.; and prizes are awarded, amid much enthusiasm and ceremony, to the successful competitors. The pastor was made to take his seat before the altar, with his two sacristans, one on *either* side.

Prescott.

(In this use, *each* or *both*, according to construction, is nearly if not quite always to be preferred. Properly, *either* refers indefinitely to one or the other of two (and often in actual use, though less accurately, to some one of any number), *each*, definitely to every one of two or any larger number considered individually, a distinction of signification which ought to be maintained, since interchange of the words (less practised by careful writers now than formerly) offers no advantage, but may create ambiguity. *Both*, two together, one and the other taken jointly, should be preferred when this is the specific sense; but *both* and *each* may often be interchanged. Thus, the camp may be pitched on *either* side of the stream (on one or the other side indifferently); there were two camps, one on *each* side, the camp was pitched on *both* sides (one camp, divided); there are fine buildings on *both* sides of the street, or on *each* side, but not on *either* side.)

But the inferred existence of your feelings, of objective groupings among them similar to those among my feelings, and of a subjective order in many respects analogous to my own — these inferred existences are in the very act of inference thrown out of my consciousness, recognized as outside of it, as not being a part of me. I propose, accordingly, to call these inferred existences *ejects*, things thrown out of my consciousness, to distinguish them from objects, things presented in my consciousness, phenomena. *W. K. ejector (ĕ-jek'tor), *n.* One who or that which ejects. Specifically — (a) In *law*, one who ejects another from or dispossesses him of his land. (b) A device for utilizing the momentum of a jet of steam or air under pressure to lift a liquid or a finely divided solid, such as sand, dust, or ashes. In the simplest form two pipes are placed one within the other, the larger one having a conical shape at the place where the smaller one enters it. A jet of steam or air passing from the smaller pipe upward into the larger pipe tends to cause any liquid, as oil or water, within reach to rise in the larger pipe. In oil-wells such a device is used to raise the oil to the surface. In another form of ejector, for lifting water, the smaller pipe enters a bend of the larger pipe near the top, the force of the jet tending to lift water through the pipe from below. The steam-ejector is also used to lift ashes from the furnace-room of a steamer and to discharge them through a pipe passing overboard above the water-line. The ejector is also used to exhaust the air of a vacuum-brake; in this case the steam-jet moves a column of air instead of water. (c) A device for throwing cartridge-shells from a firearm after firing. The common ejector of single- and double-barreled breech-loaders is a bolt underneath the gun-barrel, with a head fitted to the rim of the bore, working automatically back and forth in closing and opening the arm; in the latter movement the head catches against the rim of the shell and pushes it out of the barrel. There are many other devices, as a spring-lever, etc. — *Casual ejector*. See *casual*.

eka. [*< Skt. eka*, one. Cf. *dui*.] In *chem.*, a prefix attached to the name of an element and forming with it a provisional name for a hypothetical element which, according to the periodic system of Mendelejeff, should have such properties as to stand in the same group with the element to which the prefix is made and next to it.

For example, *eka-aluminium* was the provisional name given by Mendelejeff to a hypothetical element which in the periodic system should have such properties as to stand in the same group as aluminium and next to it. The recently discovered element gallium agrees in properties with those ascribed to *eka-aluminium*, and this name is now abandoned.

It is composed of numerous slender tubes or follicles, which secrete the greasy fluid, and the ducts of which, uniting successively in larger tubes, finally open by one or more pores, commonly upon a little nipple-like elevation. Birds press out a drop of oil with the beak, and dress the feathers with it, in the operation called *preening*. The gland is large and always present in aquatic birds, which have need of a waterproof plumage; it is smaller in land-birds, as a rule, and wanting in some. The character of the elæodoche, whether it be bare or surmounted by a cirlet of feathers, distinguishes various natural groups of birds.

2. Having, as a solid body, the power of returning to the form from which it is bent, extended, pressed, pulled, or distorted, as soon as the force applied is removed; having, as a fluid, the property of recovering its former volume after compression. A body is perfectly elastic when it has the property of resisting a given deformation equally, however that deformation may have been produced, whether slowly or suddenly, etc. All bodies, however, have different elasticities at different temperatures, and if the deformation is so sudden as to change the temperature of the body and so alter its resistance to deformation, this is not considered as showing it to be imperfectly elastic.

For the more easy understanding of the experiments triable by our engine, I thought it not superfluous nor unreasonable, in the recital of this first of them, to insinuate that notion by which it seems likely that most, if not all of them, will prove explicable. Your Lordship will easily suppose that the notion I speak of is that there is a spring, or *elastic* power, in the air we live in. By which *elastic* or spring of the air, that which I mean is this: that our air either consists of, or at least abounds with, parts of such a nature that in case they be bent or compressed by the weight of the incumbent part of the atmosphere, or by any other body, they do endeavor, as much as in them lieth, to free themselves from that pressure, by bearing against the contiguous bodies that keep them bent; and as soon as those bodies are removed, or reduced to give them way, by presently unbending and stretching out themselves, either quite, or so far forth as the contiguous bodies that resist them permit, and thereby expanding the whole parcel of air these *elastic* bodies compose.

A body is called *elastic* in which a particle moved from its natural position of equilibrium has a tendency to return to its first position as soon as the external cause which had displaced it has ceased. *Blaserna*, Sound (trans.), p. 4.

erty of being elastic, in any sense; especially, that physical force resident in the smallest sensible parts of bodies, by virtue of which the holding of them in a state of strain (change of size or shape) involves work, which for small strains is proportional to the square of the amount of the strain. There are different kinds of elasticity, corresponding to the different kinds of strain.

Their characters are useful in distinguishing species.—3. [NL.] In entom.: (a) [*cap.*] The typical genus of the family *Elateridae*, founded by Linnaeus in 1767. It comprises over 100 species, of which nearly 50 inhabit North America. They are mostly found in temperate regions, on leaves and flowers, or often under bark. They are distinguished from members of related genera by the fifth fourth tarsal joint, oblong-oval scutellum, small regularly convex head, and the sinuate single-toothed dilatation of the hind coxae. (b) One of the *Elateridae*; a click-beetle. (c) One of the elastic bristles at the end of the abdomen of the *Poduridae*. A. S. Packard. See *spring*.

Elateridae (el-a-tēr'i-dē), *n. pl.* [NL., < *Elater*², 3 (*a*), + *-idae*.] A family of sternoxine pentamerous beetles, corresponding to the Linnean genus *Elater*. The ventral segments are typically free, the first not being elongated; the tarsi are 5-jointed; the prothorax is loosely jointed to the mesothorax; the prosternum is prolonged behind; the globose front coxae are within the prosternum; the hind coxae are contiguous, laminate, and sulcate; the free ventral segments are 5 or rarely 6 in number; the labrum is free and visible; and the antennae are usually serrate, sometimes filiform, pectinate, or flabellate. The species are very numerous, and are known as *click-beetles*, *snapping-beetles*, *spring-beetles*, and *skipjacks*. Their legs are short, and when they are placed on their backs on a flat surface they right themselves with an audible snapping of their bodies. This is effected by means of the spine of the prosternum, which acts as a spring on the mesosternum, and the force being transmitted to the base of the elytra, and so to the supporting surface, the insects are jerked into the air and manage to fall on their feet. The force is remarkable, as one may experience by trying to hold one of the larger species. (See cut under *click-beetle*.) The fireflies of tropical regions are elaters, as of the genus *Pyrrophorus*. (See cut under *antenna*.) The larvae of many species are known as *wireworms*, and are very injurious to crops. See cut under *wireworm*.

elaterist (e-lat'e-ris-t), *n.* [*elater*² + *-ist*.] One who holds that many of the phenomena connected with the air-pump are to be explained by the elasticity of the air, and who maintains the truth of Boyle's law that the density of a gas is proportional to the pressure.

Although our author [Linus] confesses that air has a spring as well as a weight, yet he resolutely denies that spring to be near great enough to perform those things which his adversaries (whom for brevity sake we will venture to call *elaterists*) ascribe to it.

Boyle, *Defence against Linus*, ii.

A substance obtained from the fruit of the *Ecballium Elaterium*, or squirting cucumber, which, if it is gathered a little before it ripens, and the juice gently expressed, deposits a green sediment, which is collected and dried. Good elaterium operates as a drastic purge, and is generally administered in cases of dropsy. It contains elaterin, together with starch, resin, etc.

By it [faith] the elders obtained a good report. *Heb.* xi. 2.

Carry your head as your elders have done before you.
Sir R. L'Enfant.

3. In the Old Testament, a title of indefinite signification applied to various officers, but generally indicating in the earlier history the princes or heads of tribes, and afterward men of special influence, dignity, and authority in their local community. In the New Testament the elders are the lay element in the Sanhedrim, the supreme court of the Jewish nation in the first century.

Gather unto me all the elders of your tribes, and your officers, that I may speak these words in their ears. *Deut.* xxxi. 28.

Her husband is known in the gates, when he sitteth among the elders of the land. *Prov.* xxxi. 23.

In the first instance, at any rate originally, the head of the first house was always the head of the clan, that of the first clan also that of the tribe. All these three grades of the heads of the people, who would thus reach the total of 1,728, might certainly be also designated by one common name, and in all probability this was furnished by the name "head" or "father," also more definitely the "head of the fathers," but more frequently by the name we so often meet with of *elder*.

Ewald, *Antiq. of Israel* (trans.), p. 245.

4. In the New Testament, also the title of certain officers in the Christian church, whose functions are not clearly defined, but who apparently exercised a considerable control in the conduct of the local churches. Scholars are not agreed as to the limits or nature of their authority. The Presbyterians maintain that there were two classes of elders (1 Tim. v. 17; 1 Cor. xii. 28; Rom. xii. 6-8; Acts xv. 25, 26, xx. 28; Heb. xiii. 7, 17). The Congregationalists on the one hand, and the Episcopalians on the other, maintain that there was no distinction between ruling and teaching elders, the elder or presbyter being in their judgment identical with the pastor or shepherd of the flock (Acts xx. 28; 1 Thes. v. 12; Heb. xiii. 7, 17; 1 Tim. v. 17).

Elder is the translation of the equivalent word, which we still preserve in its Greek form of presbyter, and which is contracted through the old French forms *prester* and *prestre*, into priest. *Smith*, *N. T. Hist.*, p. 447, note.

5. In certain Protestant churches, an officer exercising governmental functions, either with or without teaching or pastoral functions. (a) In churches of the Baptist persuasion the pastors of churches are usually called *elders*, although the class especially so called are not settled pastors, but evangelists and missionaries. (b) (1) In churches of the Presbyterian order the pastor of a church is technically called the *teaching elder*, as distinguished from the *ruling elders*, commonly called simply *elders*, who are a body of laymen, varying in number, selected to assist the pastor in the oversight and government of the church. The board of ruling elders constitute with the pastor the session of the church, and are intrusted with its government and discipline, subject to the supervision of the Presbytery. Such elders are required to accept the Symbol or Confession of Faith of the Presbyterian Church; they do not administer the sacraments, but aid in the Lord's supper by distributing the elements. They are sometimes elected for life, sometimes only for a term of years. (2) In the early days of Congregationalism many churches had, besides the pastor and teacher, a *ruling elder*, charged with matters of church government and discipline.

The congregation at Watertown (whereof Mr. George Phillips was pastor) had chosen one Richard Brown for their elder. *Winthrop*, *Hist. New England*, i. 81.

I judg it not lawfull for you, being a *ruling Elder*, . . . opposed to the Elders that teach & exhorte and labore in ye word and doctrine, to which ye sacraments are annexed, to administer them, nor convenient if it were lawfull. *Robinson*, Quoted in Bradford's Plymouth Plantation, 1p. 167.

(c) In some bodies of American Methodists *elder* is the general term for any clergyman. In the Methodist Episcopal Church the *presiding elder* is an ordained clergyman appointed by and serving under the bishop as superintendent, with large though carefully defined supervisory powers within a specified "district," which usually corresponds somewhat in extent to an average county in an eastern State. In this district every minister is amenable to him, and every church is subject to his supervision and is usually visited by him three or four times during the year. He presides at Quarterly and often at District Conferences. *Traveling elders* are itinerant preachers appointed by the Annual Conference. (d) In the Mormon Church the *elder* is an officer whose duty it is "to preach and baptize; to ordain other elders, and also priests, teachers, and deacons; to lay on hands for the gift of the Holy Ghost; to bless children; and to take the lead of all meetings." The elders constitute the Melchizedek priesthood, and include the apostles, the Seventy, the evangelists or patriarchs, and the high priest. *Mormon Catechism*, xvii. (e) Among the Shakers, four *elders*, two males and two females (the latter also called *elderesses*), have charge of each of the aggregated families.

(3) A third form appears in OHG. *holantar*, *holuntar*, MHG. *holander*, *holder*, G. *holunder*, *hohlander*, *holder*, dial. *holier*. It is doubtful whether these three forms are ult. identical. Popular etym. has wrought confusion, e.g., in assimilating the forms with those of *alder*¹; cf. ME. *elder*, mod. dial. *eller*, I.G. *ellern*, G. *eller*, *alder*. The third form, OHG. *holantar*, etc., appears to consist of *hol*, the root of the word, popularly supposed to be identical with *hol*, mod. 2. The choice of a person or persons for office of any kind by the voting of a body of qualified or authorized electors. The persons voted for are called *candidates*, or, with reference to their selection as candidates, *nominees*. Election for public office is now almost universally effected by the use of printed ballots. (See *ballot*.) The decision may depend upon the casting of an actual majority of all the votes for a candidate, as in various European countries and in some of the United States, or upon a plurality or the largest number of votes for any candidate where there are more than two opposing candidates, as in most of the United States. In the former case a new election has to be held when there is no actual majority; in the latter a single balloting is final unless there is a tie, which is very rare.

And always thou makest here Queen by Election, that is most worthy in Arms.

Whether the choice in the former case is absolute or conditional is a disputed question in theology. Calvinism maintains that it is absolute; Arminianism, that it is conditional.

Knowing, brethren beloved, your election of God.

1 Thes. i. 4.

Other German princes, as the rulers of Bavaria, Hanover, etc., also had voices in the college of electoral princes for longer or shorter periods. Each State has as many electors as it has representatives and senators in Congress. No person holding an office under the United States government is eligible for an elector. — **The Great Elector**, the name usually given to Frederick William, Elector of Brandenburg from 1640 to 1688, who greatly strengthened the Brandenburg-Prussian power, and prepared the way for the elevation of the Prussian monarchy under Frederick the Great.

The occasion for the disagreement was the opposite views taken by the respective parties as to the relative validity of different sets of electoral votes returned from the lately seceded States of Louisiana, South Carolina, and Florida, and also from Oregon, which would decide the election. A number of electromagnets are connected, each with some particular station, room, or point from which a signal may come; the opening or closing of the circuit at any of these points operates the electromagnet to which it is joined, bringing into view a number, letter, or word indicating the location of the point. The light is of two general kinds, the *arc-light* and the *incandescent light*. In the first the voltaic arc is employed; in the second a resisting conductor is rendered incandescent by the current. The arc-light (see *voltaic arc*, under *arc*) is produced when a powerful current passes between two carbon electrodes, at first in contact and afterward separated a short distance, the result being the formation of the voltaic arc. The light of the arc and the glowing carbon-points has great intensity, and electric lamps of this kind are extensively used for purposes of illumination, where a powerful light (1,200 candle-power or upward) can be economically employed. In order to keep the carbon electrodes at a constant distance, so that the light may be uniform, some form of regulator is generally

needed. Commonly an electromagnet, through which the current passes, is used for this purpose. As the carbons are slowly consumed the distance between them increases; the current meets with greater resistance, and is weakened accordingly; this in turn weakens the electromagnet, which acts less powerfully on its armature, and thus through some mechanical device causes the points to approach each other. If they come too near together, the strengthened current strengthens the electromagnet, and the same contrivance pulls them apart again; so that the current automatically regulates itself. In electric candles this necessity is done away with; here, as in the Jablochhoff candle, for example, the carbon pencils are placed side by side, separated by some insulating earthy substance, the arc is formed at the top, and the candle burns away in a manner analogous to that of an ordinary candle. With these candles alternating currents are employed to obviate the difficulty that

would otherwise arise from the more rapid consumption of the carbon forming the positive pole. In an incandescent electric lamp, or glow-lamp, the current is made to pass through a strip of some substance which, because of its high resistance, becomes highly heated, and hence brilliantly incandescent. Practically, the only suitable substance known is carbon, which in the form of a thin strip or wire, carefully prepared for the purpose (for example, from a strip of bamboo) and bent in a loop, is inclosed in a bulb of glass from which the air has been exhausted. The vacuum is essential to prevent the consumption of the carbon at the high temperature to which it is raised. The incandescent light is comparable in brilliancy to a good gas-burner, and is hence suitable for general house illumination; it is superior to gas in steadiness, and has the great advantage that it does not vitiate the air. The current employed has, for lamps of ordinary power, much less strength than that needed for the arc-light. The clutch-lamp is an arc-lamp in which the rod to which the upper carbon is attached is surrounded by an annular clutch, which is raised when the circuit is completed, thus establishing the arc. **Electric log**, a ship's log in which the recording mechanism may be stopped by closing an electrical circuit through the tow-line when it is necessary to haul the log on board ship. Another form of electric log uses the recording mechanism to close a circuit through the tow-line, and report the record of the log on the vessel. See *log*.—**Electric machine**, a machine for generating large quantities of electricity. Those commonly used for producing static electricity depend upon either friction or induction for their operation. For producing current electricity a magneto-electric or dynamo-electric machine is employed. The frictional electric machine usually consists of a plate or cylinder of

glass, which is made by means of a handle to revolve between stationary cushions whose surfaces are covered with amalgam. One form of electricity (positive) is generated on the revolving plate, and is taken off by combs to a large brass cylinder called the *prime conductor*; the other (negative) is generated on the cushions, and may also be collected on a conductor, but is generally allowed to pass off to the earth through a metallic chain. The electricity obtained is the equivalent of the mechanical energy expended in turning the crank, less that which through friction is expended in producing useless heat. An induction-machine acts upon the principle of induction. Thus, in the Holtz machine no friction is used except to charge the armatures. It consists of a stationary glass plate with two open spaces, or "windows," on opposite sides of the center, and of a second glass plate which is revolved very rapidly in front of it. On the other side of the movable plate, and opposite the windows, are two combs connecting with brass conductors ending in large knobs. On one edge of each window is attached a piece of paper, called the *armature*, and a tongue of paper projects from it into the open space toward the revolving wheel. In the use of the Holtz machine and others of

the same kind a small initial charge must first be communicated to the armature. By induction this is increased until a maximum, depending on the insulating power of the machine and its supports, is reached. The electrical energy developed has its equivalent in the work done in overcoming alternate attraction and repulsion of the moving and fixed parts. The effects of an induction-machine are much more powerful than those of the plate-machine, and it is less influenced by dampness in the air. It is consequently a very useful machine in the physical laboratory, being much used for statical experiments. When a powerful current of electricity is required, a magneto-electric or dynamo-electric machine driven by a steam- or gas-engine, or by water-power, is employed. These machines depend upon the induction which takes place between magnets and coils of wire, when their relative positions are changed. (See *induction*.) The distinction between the magneto- and dynamo-machines is that in the former a permanent magnet is employed, while in the latter its place is taken by an electromagnet. A simple form of the first consists of a large horseshoe magnet, before the poles of which two bobbins wound with insulated copper wire and inclosing cores of soft iron are made to revolve; the variation in magnetic intensity and polarity as these soft iron cores alternately approach and recede from the poles of the permanent magnet produces induced currents in the wire of the bobbins. These currents are reversed for each half-revolution, and hence a machine of this type produces an alternating current. By the use of a commutator, however, the current may be rectified, so that it passes through the connecting wire always in the same direction. In another form of the machine the soft iron core is in the form of a ring, about which a number of separated coils of insulated wire are wound, the ends of which are taken to the central axis. This circular armature revolves between the poles of the horseshoe magnet, and the result is the generation of a current in one direction in one half of the coils, and in the opposite direction in the other half. The current is taken off for the outside circuit by means of two metallic brushes on each side of the central axis. The magneto-electric machine has been displaced for practical use by the dynamo-

electric machine, or dynamo. The dynamo-machines in use are of many forms, but all consist essentially of one or more large electromagnets (called the *field-magnets*) between the poles of which an armature, consisting of a soft iron core wound with coils of insulated copper wire, is made to revolve very rapidly by means of an engine. In most of them the principle of reduplication is involved—that is, commencing with a very small amount of residual magnetism in the field-magnets, the inductive action between them and the revolving armature results in the production of a feeble current in the coils. This current may be made to pass through the wire of the stationary magnets, strengthening them so that they exert a stronger inductive influence on the armature, thus producing a strong current in the coils, which again charges more strongly the field-magnets, and so on until the machine is in full action. The charging of the field-magnets is accomplished in different ways. In some forms of the machine the field-magnets are excited by independent currents, produced by separate machines; in other forms (called *series dynamos*) the current generated in the armature charges the field-magnets, and is also used for the outside work, the coils of the electromagnets, in other words, forming part of the external circuit; in still other forms (called *shunt dynamos*) a portion only of the current generated in the armature is used to charge the field-magnets, the remainder being taken off for the practical outside work. Many different forms of the machine are now in use, and they have proved an economical and convenient

means of obtaining powerful currents of electricity, when it is to be used for producing the electric light, for electroplating, for the transmission of power or energy, and so on. In the transmission of energy by electricity, the current produced by the machine is made to pass through a second machine (called an *electric motor*, generally similar to and often identical with the dynamo in form and construction, the order of working being reversed), distant a number of miles, perhaps, from the first, and there it causes the armature to revolve, and this revolution may be employed to do any kind of mechanical work. Dynamos have a high degree of efficiency, many transforming over 90 per cent. of the mechanical energy used in revolving the armature into the energy of the electric current. They furnish the electric current much more economically, as well as more regularly, than a voltaic battery, since the zinc, the fuel of the latter, is an expensive and a poor fuel, as compared with the coal used for the engine which drives the dynamo. — **Electric meter**, an instrument designed to measure the quantity of electricity supplied to consumers for the production of light or heat, or to be used as a motive power. — **Electric motor**. See *piano*. — **Electric railway**, a railway on which electricity is the motive power. The wheels of each car may be set in motion by an electric motor to which they are geared, or a motor-car may draw one or more cars. There are two distinct systems of electric railway. In one the electric motor is actuated by a current of electricity drawn from a secondary or "storage" battery carried with the car, generally underneath the floor; in the other the current is conveyed from a dynamo at some point on the line by means of conductors, which may be supported upon poles or placed in an underground conduit. — **Electric storm**, a violent disturbance of the electrical condition of the earth, resulting in strong earth-currents through long lines of telegraph, often interfering with the ordinary working of the line. These storms are sometimes widespread, and are thought by some physicists to be related to contemporaneous disturbances of the atmosphere of the sun. The phrase is also applied to unusually violent displays of atmospheric electricity. — **Electric-telegraph cable**. electrician (ē-lek'tri-sh'ān), *n.* [= *F. electricien*; as *electric + -ian*.] 1. One who studies electricity, and investigates its properties by observation and experiments; one versed in the science of electricity. — 2. One engaged in the business of making or supplying electric apparatus or appliances.

electricity (ē-lek'tris'i-ti), *n.* [= *D. elektricität* = *G. elektricität* = *Dan. Sw. elektricitet* = *F. électricité* = *Sp. electricidad* = *Pg. electricidade* = *It. elettricità*, < *NL. electricita(t)s*, < *electricus*, *electric*: see *electric*.] In *physics*, a name denoting the cause of an important class of phenomena of attraction and repulsion, chemical decomposition, etc., or, collectively, these phenomena themselves. The true nature of electricity is as yet not well understood; but it is probable that it is not, as was formerly assumed, of the nature of a fluid—either a single fluid, as was supposed by Franklin, or two fluids (positive and negative), as was supposed by Symmer. The word was first used by Gilbert, the creator of the science of electricity, and by him was applied to the phenomena of attraction and repulsion as exhibited when amber (electrum) and some other substances of a similar character were briskly rubbed. Its meaning has been gradually extended to include a large variety of phenomena, among which may be named heating, luminous and magnetic effects, chemical decomposition, etc., together with numerous apparent attractions and repulsions of matter widely differing from those originally noted, but all of which are attributed to a common cause. The subject is usually divided into the two parts of *static*

or *frictional electricity*, including the electricity produced by friction and analogous means, the phenomena of which are chiefly static, and *current electricity* (also called *voltaic electricity*), including that produced by the chemical or voltaic battery and electromagnetic machines, the phenomena of which are mostly dynamical. The form of electricity first discovered was the frictional. The discovery is generally attributed to Thales (sixth century B. C.), who observed that amber, after being rubbed by silk, had the property of attracting light bodies, like bits of paper, bran, etc. It was subsequently discovered that glass, sulphur, resin, and many other bodies gained by friction this same property to a greater or less extent. When electricity is produced by the friction of silk on glass, that of the glass is called *vitreous* or *positive electricity*, while that of the silk rubber is called *resinous* or *negative electricity*. When produced by the friction of flannel or silk on sealing-wax, that of the wax is *negative*, and that of the flannel or silk rubber is *positive*. This distinction, which, however, is properly explained as due to a difference of electrical potential (see *potential*), extends through the whole subject, by whatever means the electricity is produced. It is found universally true that the two kinds of electricity are produced in equal amounts. Besides friction, there are other means of exciting electricity, as pressure between two bodies or sudden fracture (by which means sugar becomes faintly luminous when broken in the dark). If a piece of sealing-wax is broken, the opposite ends will be found to be dissimilarly electrified. This is especially true of the fracture of cleavable minerals, like mica, calcite, etc. Some crystallized bodies become electrified by change of temperature: for example, a crystal of tourmaline, on being slightly warmed, becomes positively electrified at one extremity, and negatively at the other; if cooled, the poles are reversed. (See *pyro-electricity*.) For the chief means of obtaining a supply of frictional electricity, see *electric machine*, under *electric*, and *electrophorus*. The principal subjects considered under the head of static electricity are the distribution of electricity over the surface of a conductor, as determined by its shape or the proximity of other electrified bodies (see *density*); the effect of induction or the production of an electrified state in a neutral body by approaching it to one already electrified, but without contact; the degree of induction, as determined by the nature of the non-conductor or dielectric (see *induction*, *conductor*, *dielectric*); the accumulation of electricity in a condenser, as a Leyden jar (see *condenser*, and *Leyden jar*, under *jar*); the measurement of capacity, potential, quantity, etc. (as with an electrometer); and the phenomena of discharge, as the spark-discharge, which takes place between oppositely electrified bodies when they are brought near together, the brush-discharge, etc. The electricity generated by friction and analogous means is in a state of high potential (see *potential*), but the quantity, and therefore the amount of electrical energy, is generally small; it has the power of overcoming great resistances and producing violent mechanical effects, as seen in the discharge of a Holtz machine, and still more strikingly in the case of lightning. Frictional electricity has found but few useful applications in the arts. The common means of producing current electricity is the voltaic battery. (See *battery* and *cell*.) Electrical currents may also be obtained by revolving a coil of wire in the space (magnetic field) between the poles of a steel magnet or electromagnet, so as to cut the lines of force between these poles. This principle is made use of in magneto-electric and dynamo-electric machines (see *electric*) to obtain powerful currents of electricity for practical use. A current may also be produced by soldering together two ends of two bars of different metals, connecting the other ends with a copper wire, and then heating (or cooling) the first point of union. This is called *thermo-electricity*, and the pair of metals is called a *thermo-electric couple*; it is analogous to the voltaic couple, only here the electrical current is obtained at the expense of the heat supplied. (See *thermo-electricity*.) The principal subjects considered under the head of current electricity are the effects of the current in causing chemical decomposition (see *electrolysis*, *electrometallurgy*), in producing heat and light through the resistance of the medium, including the voltaic arc, and in the production of induced currents in a coil of wire, under certain conditions, by the action of another current or a magnet (see *induction*); the measurement of strength of current (as with a galvanometer or *ampere-meter*, which see), of electromotive force (as with a volt-meter), and of resistance (as with the electric bridge or ohm-meter), etc. The current electricity produced by the chemical battery or ordinary dynamo-machine differs from the static electricity of the frictional or induction machine, in that the difference of potentials of the poles, or, in other words, the electromotive force of the current when the poles are connected, is relatively small, while the quantity of electricity is relatively enormously large. Correspondingly, ordinary current electricity has relatively very little power of overcoming a high resistance; no spark is obtained, even from a powerful battery, when the poles are separated by so much as a small fraction of an inch; but the current can do a large amount of work in producing chemical decomposition (as in the electrolysis of water), or mechanically, when transformed by an electric motor. Induced currents, however, as those produced by an induction-coil (which see), may have a very high electromotive force and consequent power of overcoming resistance. — **Animal electricity**. See *animal*. — **Contact theory of electricity**, a theory which assumes that the electromotive force of a voltaic cell, and perhaps the electricity produced by friction, is due to the difference of potential assumed by two dissimilar substances when placed in contact. — **Diffusion of electricity**. See *diffusion*. — **Distribution of electricity**. See *distribution*. — **Electrostatic units of electricity**. See *electrostatic*. — **Excitation of electricity**. See *excitation*. — **Free and bound electricity**. By a "free" charge of electricity is generally meant one which is borne by an insulated body independently of surrounding objects, while a "bound" charge is one held in position by the presence and attraction of a charge of the opposite character or sign upon a neighboring body. As a matter of fact all charges are "bound," the production of a given quantity of one kind of electricity being always accompanied by the production of the same quantity of the opposite kind. When this complementary

charge is very distant and widely distributed, as on the walls of a room, the first may be said to be "free" electricity.

Cf. *analysis*.] The decomposition of a chemical compound, called the *electrolyte*, into its constituent parts by an electric current. Thus, water is decomposed by electrolysis into hydrogen and oxygen; of these it is found that the hydrogen is attracted by the negative pole (the cathode), and is hence said to be *electropositive*, and is called the *cation*; while the oxygen collects at the positive pole (the anode), and is said to be *electronegative*, and is called the *anion*. Similarly, by experimenting with different compounds and observing the behavior in each case, an electrochemical series of the elements, arranged in order, from oxygen, the most negative, to the most positive metals, sodium, potassium, etc., has been deduced. A salt may also be decomposed by electrolysis: thus, copper sulphate yields metallic copper at the negative pole (upon which it is deposited), and sulphuric acid at the positive pole. By electrolysis Davy was able to decompose lime and the other alkaline earths, and thus to show that they were compounds of metals, calcium, etc., with oxygen. An electrolysis in which the ions (a term including both anion and cation) are produced at their respective electrodes without interference from these electrodes or the surrounding electrolyte is called a *primary electrolysis*. Very often combinations take place between the ions and the electrodes or the electrolyte, so that the final products are different from the true ions. This is called *secondary electrolysis*. For the application of electrolysis in the arts, see *electrometallurgy*.

electromagnet (ē-lek'trō-mag'net), *n.* A magnet which owes its magnetic properties to the inductive action of an electric current. If an insulated wire is wound about a bar

Electromagnet.

of soft iron and a current of electricity is passed through it, the bar becomes a temporary magnet with a north and a south pole; the end at which the current circulates through the wire in the direction of the hands of a clock, as the observer looks at it, is the south pole. In practice, an electromagnet has ordinarily a horseshoe form. It consists of two cylinders, or cores, of soft iron, fastened together at one end and each wound many times with insulated wire; the wire must be so wound that if the horseshoe were straightened the direction of winding would be the same throughout. An electromagnet may be made very powerful, so as to support a ton or more. The soft iron core retains its maximum magnetization only so long as the current is passing, and loses nearly all of it the instant the current ceases. This principle is made use of in the telegraph (which see), electric clocks, electric call-bells, etc. If the core is made of steel, it becomes under the action of the current a permanent magnet.

electromagnetism (ē-lek'trō-mag-net-izm), *n.* The collective term for the phenomena which rest upon the relation between electric currents and magnetism. It comprises the effects of an electric current in directing a magnetic needle and in inducing magnetism in a magnetic substance, as soft iron, and also the analogous effects of a magnet in directing a movable conductor traversed by a current, or in inducing in a conductor an electric current. The directive power of an electric current upon a magnet was discovered by Ørsted; it is the principle involved in all forms of galvanometer (which see). The power of an electric current to induce magnetism, and of a magnet to induce an electric current, is treated under *induction*; these latter phenomena form the basis of the electromagnet and of all forms of magneto-electric and dynamo-electric machines.

electrometallurgy (ē-lek'trō-met'al-ēr-jī), *n.* The art of depositing certain metals, as gold, silver, copper, etc., from their solutions by means of the slow action of an electric current. Its most important applications are electroplating and electrolytic. The essential parts of the process of plating with copper, for example, are as follows: If the surface upon which the metal is to be deposited is a mold (as of a medal) of gutta-percha or wax, it must be made a conductor by having its surface brushed over with powdered graphite. It is then attached to the negative pole of the battery and suspended in the solution of the required metal, as copper sulphate, the positive pole at the same time consisting of a plate of the same metal. The result of the electrolysis (see *electrolysis*) caused by the passage of the current is the decomposition of the solution, the metal being deposited upon the exposed surface at the negative pole, and sulphuric acid being formed at the positive pole; the acid, however, dissolves a part of the copperplate, and thus keeps the solution of constant strength. A current of uniform strength is necessary. Iron and nickel are deposited from solutions of their double salts with ammonium; gold and silver, from alkaline solutions containing potassium cyanide.

electrometer (ē-lek'trom'ē-tēr), *n.* [= D. G. Dan. Sw. *elektrometer* = F. *électromètre* = Sp. *electrómetro* = Pg. *electrometro* = It. *elettrometro*, < Gr. ἤλεκτρον, amber (repr. electricity), + μέτρον, a measure.] An instrument for measuring difference of electrostatic potential between two conductors. See *potential*. There are many forms. The *absolute electrometer* (also called *balance-electrometer*) of Sir William Thomson consists essentially of two parallel circular plates attracting each other, the central portion of one of them, the upper, suspended from one arm of a balance or by means of light steel springs, the other being movable to a greater or less distance from the first by means of a micrometer screw. The upper disk is always brought to a fixed position (which can be very accurately determined) by means of the attraction of the lower, the amount of attraction being regulated by the distance between the two plates. It is thus seen that the electric force is actually weighed, and formulas are given by means of which the difference of potentials is deducible in absolute measure, the areas of the plates and the distance between them being known. The *quadrant electrometer* of Sir William Thomson consists of four quadrant-shaped pieces of metal, sometimes segments of a flat cylindrical box, the alternate pairs being connected by a wire;

above or within this, if the cylindrical form is used, a flat needle of aluminium is hung by a delicate wire. The needle is kept in a constant electrical condition by connection usually with a Leyden jar placed above or below, and if the two pairs of quadrants are dissimilarly electrified—that is, are in a state of different potential, as by connecting them respectively with the poles of a voltaic cell—the needle is deflected from its position of rest, and the amount of this deflection, as measured by the motion of a spot of light reflected from a small mirror attached to it, gives a means of calculating the difference of potential of the bodies under experiment. In another method of using the quadrant electrometer the pairs of quadrants are kept at a constant difference of potential, while that of the needle varies. Arranged in this manner, it is much used in the investigation of atmospheric electricity. Lippmann and Dewar have devised very delicate capillary electrometers, based on the alteration of the force of capillarity by electric action. See *electrocapillary*.

F.*), that which determines the flow of electricity from one place to another, giving rise to an electric current. It is the result of, and proportional to, the difference of electric potential (see *potential*) between two bodies, or parts of the same body, and bears a similar relation to it that the pressure in a water-pipe does to the difference of water-level upon which its amount depends. The strength of an electric current is directly proportional to the electromotive force, and inversely proportional to the resistance (Ohm's law). The electromotive force is measured in volts.—**Electromotive series,** the series of the various metals (or other substances) useful for producing an electric current, arranged in such an order for a given liquid that each is positive with reference to those which follow in the list, and negative for those which precede. For example, in dilute sulphuric acid the order is zinc, lead, iron, copper, silver, platinum, carbon—that is, if zinc and iron are coupled together in a voltaic cell containing sulphuric acid, the zinc is the positive plate, and the current goes in the wire from iron to zinc; if iron and copper are taken, the current in the wire is from copper to iron. It is found that the electromotive force is a maximum for zinc and carbon, and is equal to the sum of the electromotive forces for all the intervening metals. In another liquid the order would be changed, but the above law would hold true; for example, in potassium sulphid, iron is electro-negative with reference to copper. Also called *contact series*.

electromotograph (ē-lek'trō-mō'tō-gráf), *n.* A name sometimes applied to a peculiar telephone-receiver invented by Edison. The vibrations of the mica disk by which the sound is reproduced are caused by variations in frictional resistance between a revolving cylinder of lime and a small platinum plate which rests upon its surface and is attached to the center of the disk, these variations being due to variations in the strength of the current transmitted.

It has been recommended for use as a telegraphic relay capable of giving two or four signs with a single wire, having this advantage over other relays, that perfection of contact is not necessary to its working. It has been used also to indicate the electric equilibrium of muscle and nervous tissue by the variation of its tones, and by a system of levers attached to the wrist to show the rhythm and character of the pulse; and it may be fitted to the telephone, and thus be made to repeat a sound made gently in one place in trumpet-tones in another place hundreds of yards distant. *Chambers's Encyc.*

Pl. *electrophori* (-ri). An instrument for obtaining static electricity by means of induction. It consists of a disk of resin, or other non-conducting material easily excited by friction, and a polished metal disk with an insulating handle. The resin disk is negatively electrified by striking or rubbing it with a cat's skin or flannel, and the metal plate is then laid upon it. Under those circumstances the upper plate does not receive a direct charge from the lower, but is positively charged on the lower surface and negatively on the upper; if now the disk is touched by the finger, the negative electricity passes to the ground, leaving the disk charged positively. On being lifted away by its insulating handle, it is found to be charged, and will give a spark. It may then be replaced on the lower plate, and the process repeated an indefinite number of times without any fresh excitation, if the weather is favorable. The electricity obtained each time is the equivalent of the mechanical work done in separating the two surfaces against the attraction of the unlike electricities.

To *electroplate* is to disguise with an adherent thin coating of metal, which then serves as an ornamental covering to the object treated. To *electrotype*, on the other hand, is to produce a separate and distinct object, with an existence of its own. *J. W. Urquhart, Electrotyping, p. 4.*

electroplating (ē-lek'trō-plā-ting), *n.* 1. The process or art of coating metals and other materials with an adherent film of metal, in a bath containing a solution of the metal, by means of the electrolytic action of an electric current from a battery or dynamo. In simple forms of electroplating apparatus, the bath containing the metallic solution may form the battery, as in plating with copper. The more common plan is to employ a current obtained from some source outside the bath. Table-cutlery or ware, building- or car-fixtures, lamps, etc., to be electroplated, are suspended by wires from a metal rod laid across the top of the bath and connected with the negative pole of the battery, this terminal of the current forming the *cathode*. The silver, nickel, copper, etc., to be deposited is suspended in like manner from a rod connected with the positive pole of the battery, the terminal forming the *anode*. (See *electrolysis, electrometallurgy*.) The deposition of metals by electrolysis forms a part of several arts, as in electrotyping; but as in these the film of metal deposited in the bath is not adherent, they are described under separate heads. Electroplating is strictly the covering of a metal with a metallic film permanently attached to it, as in nickel-plating, plating telegraph-wires with copper, and table-ware with silver. See *electrotype, galvanoplastic, galvanography, galvanograph, and nickel-plating*. 2. The deposit itself, or the surface, obtained by means of the process explained above.

Sw. elektro-skop* = *F. électroscope* = *Sp. electroscope* = *Pg. electrosco-pio* = *It. elettroscopio*, < *NL. *electroscopium*, < *Gr. ἤλεκτρον, amber* (repr. electricity), + *σκοπεῖν, view*.] An instrument for observing or detecting the existence of free electricity, and, in general, for determining its kind. All electroscopes depend for their action on the elementary law of electric forces, that bodies similarly charged repel each other, while bodies dissimilarly charged attract each other. The simplest electroscope consists of pith-balls suspended by silk threads; another simple form consists of a pair of short pieces of straw suspended by silk threads. When not in use the pieces of straw hang down, touching each other. On presenting an electrified body to them they become ex-

cited and stand apart, thus giving a test for electricity. The gold-leaf electroscope of Bennet, introduced in 1789, consists of two pieces of gold-leaf, about 1/4 inch broad, fixed to a brass rod and hung inside a glass globe which has been thoroughly dried, in order that the insulation of the apparatus may be as nearly perfect as possible. The globe is closed with a wooden stopper, through the center of which passes a glass tube containing the brass rod. The

Quadrant Electroscope.

upper end of the rod is furnished with a knob. If an electrified body is brought near the top of the instrument, induction takes place; the top becomes electrified oppositely to the body presented, and the pieces of gold-leaf similarly. To find if the latter are positively or negatively charged, a glass rod is rubbed and brought near the knob; if positively charged, the leaves will diverge still more under the induction of the glass; if negatively, they will collapse, the negative electricity being attracted to the positive of the glass rod. In Volta's condensing electroscope, in place of the gilt knob there is a flat metal plate upon which rests another similar plate, which may be removed by an insulating handle.—**Quadrant electroscope**, a form of pith-ball electroscope which serves to measure roughly the degree of electrification by the rise of the pith-ball as indicated by the motion of the rod carrying it on a graduated semicircle.

From the time of Herodotus on its most common meaning in Greek was 'amber,' but it was also used for 'pure gold,' as by Sophocles. The Romans used *electrum* with the meaning of 'amber,' also as designating an alloy, which might be either natural or artificial, of silver and gold (Pliny gives the amount of silver present in electrum at one fifth of the whole). Later on, *electrum* was confounded with *orichalc* (which see), and in the middle ages had acquired the definite meaning of 'brass.' At all times, and especially among the Latin writers, there was more or less uncertainty in regard to the meaning of this word, and there was a tendency among both Greeks and Romans to use it just as *adamant* was frequently used, namely, as designating some ideal, imperfectly known substance possessed of almost miraculous properties.

It. *elegiaco*, < LL. *elegiacus*, < Gr. *ἐλεγιακός*, < *ἐλεγεία*, *ἐλεγείον*, an elegy: see *elegy*.] I. *a.* 1. — — — | — — — | — — — | — — — | — — — | — — —

Verses or poems consisting of elegiac distichs are called *elegiac verses* or *poems* (*elegiacs*); poetry composed in this meter, *elegiac verse* or *poetry* (*the elegy*); and the writers who employed this verse, especially those who employed it exclusively or by preference, are known as the *elegiac poets*. *Elegiac* verse seems to have been used primarily in threnetic pieces (poems lamenting or commemorating the dead), or to have been associated with music of a kind regarded by the Greeks as mournful. Almost from its first appearance in literature, however, it is found used for compositions of various kinds. The principal Roman elegiac poets are Catullus, Tibullus, Propertius, and Ovid. In modern German literature the elegiac meter has been frequently used, especially by Goethe and Schiller. Coleridge's translation from the latter poet may serve as an example in English.

There's little of the melancholy element in her, my lord.

Shak., Much Ado, II. 1.

(b) pl. The rudimentary principles of any science: as, Euclid's "*Elements*" (*Gr. στοιχεια*), a work setting forth in an orderly and logical way the simple and fundamental propositions of geometry. (c) In geom., one of the points, lines, or planes, or other geometrical forms, by which a figure or geometrical construction is made up. "Space may be considered as a geometrical figure whose elements are either points or planes. Taking the points as elements, the straight lines of space are so many ranges, and the planes of space so many planes of points. If, on the other hand, the planes are considered as elements, the straight lines of space are the axes of so many axial pencils, and points of space are centers of so many sheaves of planes" (*Cremona*, *Geom.*, tr. by Leudesdorf, § 81). (d) In math., one of a number of objects arranged in a symmetrical or regular figure. "The elements of a determinant are the quantities arranged in a square block or matrix, the sum of whose products forms the determinant." (e) In astron., one of the quantities necessary to be known in calculating the place of a planet (perhaps because the planets were called *elements*). They are six, namely, the longitude of the ascending node, the inclination of the orbit to the ecliptic, the longitude of the perihelion, the mean distance from the sun, the mean longitude at any epoch, and the eccentricity. Hence—(f) A datum required for the solution of any problem. (g) pl. The bread and wine used in the eucharist: distinctively called *communion elements*.

When all have communicated, the Bishop shall return to the Lord's Table, and reverently place upon it what remaineth of the consecrated *Elements*, covering the same with a fair linen cloth.

Book of Common Prayer, Holy Communion.

(h) In biol., one of the primary or embryological parts composing the body of an animal, or of the pieces which have united to form any part. Thus, the thorax of an insect is composed of three principal *elements* or rings, the epicranium is formed of several *elements* or pieces which are soldered together, etc. (i) In elect., a voltaic cell. See *cell*.

The bichromate of potassium batteries, composed of four troughs with six compartments, making twenty-four *elements* in circuit. A mercury commutator enabled us to use at pleasure six, twelve, eighteen, or twenty-four *elements*, and thus to obtain four different speeds of the screw [of an electric balloon].

Science, III. 154.

2. One of the four things, fire, water, earth, and air (to which ether was added as a fifth element), falsely regarded by the ancients as the constituents of which all things are composed. Water, as an element, consists of all that is in the rain, the rivers, the sea, etc.; fire, of lightning, the sun, etc.; these, together with the air and earth, were supposed to make up the matter of nature. The *elements* often means in a particular sense wind and water, especially in action: as, the fury of the *elements*.

"It is a water that is mad, I saye,
Of *elementes* foure," quod Plato.

Chaucer, Canon's Yoeman's Tale (ed. Skeat), G. I. 1460.

3e haue thanne in the ampulle ij. *elementis*. that is to seie, watir and eyr.

Book of Quinte Essence (ed. Furnivall), p. 12.

My Ariel,—chick,—

That is thy charge; then to the *elements*!

Be free, and fare thou well! Shak., Tempest, v. 1.

I've heard

Schoolmen affirm, man's body is compos'd
Of the four *elements*. Massinger, Renegado, III. 2.

And, lost each human trace, surrendering up
Thine individual being, shalt thou go
To mix forever with the *elements*.

Bryant, Thanatopsis.

3. A kind of matter undecomposable into other kinds. The elements as enumerated by Empedocles, and generally recognized in antiquity, were four—fire, water, earth, and air. (See 2.) The older chemists, of the fifteenth century and later, recognized three elements—sulphur, mercury, and salt. In modern chemistry an element, or elementary body, is regarded merely as a simple substance which has hitherto resisted analysis by any known chemical means. The list of such elements is a provisional one, since it is possible, and not improbable, that many bodies now considered elementary may be proved to be compound. There are over 70 elements at present (1890) recognized by chemists, commonly divided into two groups, namely, *metals* and the *non-metallic bodies* or *metalloids*. The non-metallic elements are hydrogen, chlorine, bromine, iodine, fluorine, oxygen, sulphur, selenium, tellurium, nitrogen, phosphorus, arsenic, antimony, bismuth, boron, silicon, and carbon. (See *metalloid*.) The remaining elements are regarded as *metals*. (See *metal*.) Five of the elements, oxygen, nitrogen, hydrogen, chlorine, and fluorine, are gases at ordinary temperatures; two, bromine and mercury, are liquids; the rest are solids. The properties of all the elements bear a close relation to their atomic

weights. (See *periodic law*, under *periodic*.) The following is a list of the elements with symbols and atomic weights.

There are a number of other bodies which have been named as elements (as phillipium, norwegium, etc.), whose properties have, however, not yet been sufficiently investigated and defined to warrant their inclusion in the list.

4. The proper or natural environment of anything; that in which something exists; hence, the sphere of experience of a person; the class of persons with whom one naturally associates, or the sphere of life with which one is familiar: as, he is out of his *element*.

We are simple men; we do not know what's brought to pass under the profession of fortune-telling. She works by charms, by spells, by the figure, and such dabbery as this is, beyond our *element*. We know nothing.

Shak., M. W. of W., IV. 2.

2. Pertaining or relating to first principles; simple; elementary. [Obsolete or archaic.]

elemi (el'e-mi), *n.* [= F. *élémi* = Sp. *elemi* = Pg. It. *elemi*; of Eastern, said to be of Ar., origin.] A name of fragrant resins of various kinds, all of them probably the product of trees belonging to the natural order *Burseraceae*. The Oriental or African elemi of the older writers is an exudation from *Boswellia Freeriana*, a tree found in the region south of the gulf of Aden. It is used in the East for chewing, like mastic. The elemi of pharmacy comes chiefly from Manila, and is the product of *Casuarina communis*. It is a stimulant resin, and is used in plasters and ointments. Also *elenchus*.

Reprehension or *elench* is a syllogism which gathereth a conclusion contrary to the assertion of the respondent. *Blundeville (1609).*

The sophistical *elenchus* or refutation, being a delusive semblance of refutation which imposes on ordinary men and induces them to accept it as real, cannot be properly understood without the theory of *elenchus* in general; nor can this last be understood without the entire theory of the syllogism, since the *elenchus* is only one variety of syllogism. The *elenchus* is a syllogism with a conclusion contradictory to or refutative of some enunciated thesis or proposition. Accordingly we must understand the conditions of a good and valid syllogism before we study those of a valid *elenchus*; these last, again, must be understood, before we enter on the distinctive attributes of the pseudo-*elenchus* — the sophistical, invalid, or sham, refutation. *Grote.*

tinae, and comprehending two living species, namely, *Elephas indicus* and *Elephas (Loxodon) africanus*. The former inhabits India, and is characterized by a concave high forehead, small ears, and comparatively small tusks; the latter is found in Africa, and has a convex forehead, great flapping ears, and large tusks. The tusks occur in both sexes, curving upward from the extremity of the upper jaw. The nose is prolonged into a cylindrical trunk or proboscis, at the extremity of which the nostrils open. The trunk is extremely flexible and highly sensitive, and terminates in a finger-like prehensile

occasioning the destruction of great numbers of these animals. Ten species of fossil elephants have been described, of which the best-known is the hairy mammoth, *E. primigenius*. The mastodons are nearly related to elephants, but form a separate subfamily *Mastodontinae* (which see).

See *hoisting-engine*. (b) A structure for storing grain in bulk, including the grain-lifters and conveyers. In such elevators the elevator proper, or lifter, is a continuous band of leather studded with metal cups or elevator-buckets, passing over a pulley at the top of the building and under a second pulley on the elevator-boot, or the foot of an inclosed tube called the *elevator-leg* (see *leg*). In some instances the elevator-leg is pivoted at the top, so that it may swing clear of the building and reach into the hold of the vessel or car to be emptied. The structure itself consists of a nest of deep bins, into which the grain is directed by spouts from the top of the lifter. The capacity of such elevators is often one and a half million bushels or more. For the horizontal movement of grain in elevators,

conveyers are used. Lifting elevators are also used in flour-mills, grinding-mills, furnaces, and other works, to handle materials of all kinds in bulk, as sand, ashes, ice, etc.

Such elevators are used to transfer grain from barges to the holds of ships.—**Hydraulic elevator,** an elevator operated by some kind of hydraulic apparatus. For short lifts the hydraulic press is sometimes used, particularly where the weight to be raised is great. Another form, for light loads and moderate heights, is a telescopic tube supporting the car at the upper end. On filling the tube with water under pressure it expands and raises the car; to lower it, the supply of water is cut off, and that in the tube is allowed to escape. The most common form of hydraulic elevator in the United States is that of a car lifted by ropes, operated by a piston in a long cylinder. The rope is connected directly with the piston-rod, which is moved by the admission of water under pressure. In some instances the cylinder is horizontal and the travel of the piston limited, multiplying gear being fitted to the rope. The usual form is an upright cylinder with a very simple form of rope-gearing.—**Pneumatic elevator,** a hoisting or lifting apparatus worked by compressed air; a pneumatic hoist.

I do not doubt but that perfect *elization* was able to contribute something to its preservation, because the sundry principles of which flesh consisteth had, whilst the heat continued, exerted their strength upon one another far better than if, the flesh being less boiled, by reason of the great avolation of parts, had been removed from the fire, as happens in ordinary coctions.

elixir (ē-lik'sēr), *n.* [Formerly also *elixar*; *< ME. elixir = D. elixer = Sw. Dan. In alchemy, a soluble solid substance which was believed to have the property of transmuting baser metals into silver or gold and of prolonging life. The great *elixir*, also called the *philosopher's stone*, or the *red tincture*, when shaken in very small quantity into melted silver, lead, or other base metal, was said to transmute it into gold. In minute doses it was supposed to prolong life and restore youth, and was then called the *elixir vitæ*. The lesser *elixir*, stone of the second class, or white tincture, was regarded as having these qualities in lesser degree; thus it transmuted baser metals into silver. The word is now often used figuratively.*

Chaucer; Prol. to Canon's Yeoman's Tale, I. 310.

He that has once the flower of the sun,
The perfect ruby, which we call *elixir*, . . .
Can confer honour, love, respect, long life;
Give safety, valour, yes, and victory,

The air we breathed was an *elixir* of immortality.

B. Taylor, Lands of the Saracen, p. 89.

2. In med., formerly, a tincture with more than one base; in modern pharmacy, an aromatic, sweetened, spirituous preparation containing small quantities of active medicinal substances. The first object sought in the modern *elixir* is an agreeable taste, and usually this is attained only by such sacrifices as to render the effect of the medicine almost nil.

U. S. Dispensatory, p. 537.

3. The inmost principle; absolute embodiment or exemplification. [Rare or obsolete.]

She is not such a kind of evil as hath any good or use in it, which many evils have, but a distill'd quintessence, a pure *elixir* of mischief.

Elxir of vitriol, aromatic sulphuric acid; a mixture of sulphuric acid, cinnamon, ginger, and alcohol.—**Elxir proprietatis**, a decoction of aloes, saffron, and myrrh in vinegar. Commonly abbreviated *elixir pro*.

Paracelsus declared them an *elixir* made of aloes, saffron, and myrrh would prove a vivifying and preserving balsam, able to continue health and long life to its utmost limits; and hence he calls it by the lofty title of *elixir of propriety* to man; but concealed the preparation, in which Helmont asserts the alchemist is required.

Elizabethan (ē-liz-a-beth'an), *a.* Of or pertaining to Elizabeth (daughter of Henry VIII. and Anne Boleyn), Queen of England from 1558 to 1603, or to her times.

A new crop of geniuses like those of the *Elizabethan* age may be born in this age, and, with happy heart and a bias for theism, bring asceticism, duty, and magnanimity into vogue again.

gular heterogeneity in detail, with, however, much picturesqueness in general effect. Its chief characteristics are: windows large, either in the plane of the wall or deeply embayed, long galleries, tall and highly decorated chimneys, and a profuse use of ornamental strapwork in par-

apets, window-heads, etc. The Elizabethan style is the last stage of the Tudor or Perpendicular, and, from its correspondence in period with the Renaissance of the continent, has sometimes been called the *English Renaissance*. The epithet *Jacobean* has been given to the latest variety of the Elizabethan, differing from the Elizabethan proper in showing a greater proportion of corrupt Italian forms.

The house was an admirable specimen of complete *Elizabethan*, a multitudinous cluster of gables and porches, oriels and turrets, screens of ivy and pinnacles of slate.

H. James, Jr., Pass. Pilgrim, p. 47.

Elizabethan literature, the literature produced during the reign of Queen Elizabeth, which was one of the most prolific and well-marked periods of English literary activity. It was very remarkable for the variety, vigor, and permanent value of much of its prose and verse, and especially for the great number and productiveness of its dramatic writers. The two most eminent names in this literature are those of Francis Bacon, one of the greatest of philosophers, and William Shakspeare, the greatest of all dramatists.—**Elizabethan type**. The English ell, not yet obsolete, is a yard and a quarter, or 45 inches. This unit seems to have been imported from France under the Tudors; and a statute of 1409 recognizes no difference between the ell (aune) and the yard (verge). The Scotch ell was 37 Scotch inches, or 37.0968 English inches. The so-called Flemish ell differed in different places, but averaged 27.4 English inches. Other well-ascertained ells were the following: ell of Austria, 30.676 English inches; of Bavaria, 32.702 inches; of Bremen, 22.773 inches; of Cassel, 22.424 inches; of France, 47.245 inches; of Poland, 22.650 inches; of Prussia, 26.259 inches; of Saxony, 22.257 inches; of Sweden, 23.378 inches. λείπειν, leave. Cf. *ellipsis*.] In geom., a plane curve such that the sums of the distances of each point in its periphery from two fixed points, the foci, are equal. It is a conic section (see *conic*) formed by the intersection of a cone by a plane which cuts obliquely the axis and the opposite sides of the cone. The ellipse is a conic which does not extend to infinity, and whose intersections with the line at infinity are imaginary.

Every ellipse has a center, which is a point such that it bisects every chord passing through it. Such chords are called *diameters of the ellipse*. A pair of conjugate diameters bisect, each of them, all chords parallel to the other. The longest diameter is called the *transverse axis*, also the *latus transversum*; it passes through the foci. The shortest diameter is called the *conjugate axis*. The extremities of the transverse axis are called the *vertices*. (See *conic*, *eccentricity*, *angle*.) An ellipse may also be regarded as a flattened circle—that is, as a circle all the chords of which parallel to a given chord have been shortened in a fixed ratio by cutting off equal lengths from the two extremities. The two lines from the foci to any point of an ellipse make equal angles with the tangent at that point. To construct an ellipse, assume any line whatever, AB, to be what is called the *latus rectum*. At its extremity erect the perpendicular AD of any length, called the *latus transversum* (transverse axis). Connect BD, and complete the rectangle ADBK. From any point L, on the line AB, erect the perpendicular LZ, cutting BK in Z and BD in H. Draw a line HQ, completing the rectangle ALHQ. There are now two points, E and E', on the line LZ, such that the square on LE or LE' is equal to the rectangle ALHQ. The locus of all such points, found by taking L at

different places on the line AD, forms an ellipse. [The name *ellipse* in its Greek form was given to the curve, which had been previously called the section of the acute-angled cone, by Apollonius of Perga, called by the Greeks "the great conoid." The participle *ἐλλειπτικός*, "falling short," had long been technically applied to a rectangle one of whose sides coincides with a part of a given line (see *Euclid*, VI. 27). So *παρὰβαλλειν* and *ὑπερβαλλειν* (*Euclid*, VI. 28, 29) were said of a rectangle whose side extends just as far and overlaps respectively the extremity of a given line. Apollonius first defined the conic sections by plane constructions, using the *latus rectum* and *latus transversum* (transverse axis), as above. The ellipse was so called by him because, since the point L lies between A and D, the rectangle ALHQ "falls short" of the *latus rectum* AB. In the case of the hyperbola L lies either to the left of A or to the right of D, and the rectangle ALHQ "overlaps" the *latus rectum*. In the case of the parabola there is no *latus transversum*, but the line BK extends to infinity, and the rectangle equal to the square of the ordinate has the *latus rectum* for one side.]—**Cubical ellipse**. In gram., omission; a figure of syntax by which a part of a sentence or phrase is used for the whole, by the omission of one or more words, leaving the full form to be understood or completed by the reader or hearer: as, "the heroic virtues I admire," for "the heroic virtues which I admire"; "prythee, peace," for "I pray thee, hold thy peace."—2. The American species are distinguished as the American elm, white elm, or water-elm, *U. americana*; the cedar-elm of Texas, *U. crassifolia*; the cork-, cliff-, hickory-, swamp-, or rock-elm, *U. racemosa*; the red elm, slippery-elm, or moose-elm, *U. fulva*, the inner bark of which is mucilaginous, and is used in medicine; and the winged elm, or wahoo, *U. alata*, with corky-winged branches. In Australia the name is given to the *Aphananthe Philippinensis*, a species allied to the true elm. In the West Indies *Cordia Gerascanthus* and *C. gerascanthoides*, of the order Boraginaceae, receive the name, as also the rubiacious *Hamelia pentricosa*. The wood is the toughest of European woods, and is considered to bear the driving of bolts and nails better than any other. It is very durable under water, and is frequently used for keels of ships, for boat-building, and for many structures exposed to wet, or when great strength is required. Because of its toughness, it is used for masts of vessels, shells for tackle-blocks, and common turnery. Witch-elm is much used by coach-makers, and by ship-builders for making jolly-boats. Rock-elm is much used in boat-building, and to some extent for bows.

The elm delights in a sound, sweet, and fertile land, something more inclin'd to moisture, and where good pasture is produced. *Evelyn, Sylva*, iv. § 6.

= *Syn. 1. Elocution, Delivery*. These words are quite independent of their derivation. *Elocution* has narrowed its meaning (see quotation from *E. Porter*, above), and has broadened it to take in gesture. They are now essentially the same, covering bodily carriage and gesture as well as the use of the voice. *Elocution* sometimes seems more manifestly a matter of art than *delivery*. See *oratory*.

Biblical critics are not agreed as to the reason for the use of the plural form: some regard it as a covert suggestion of the Trinity, others as a plural of excellence; others as an indication of an earlier polytheistic belief; still others as an embodiment of the Hebrew faith that the powers represented by the gods of the heathen were all included in one Divine Person.

Elohistic (el-ō-his'tik), *a.* [*cf. Elohist* + *-ic*.] A term applied to certain passages in the Pentateuch, in which God is always spoken of in the Hebrew text as Elohim, supposed by some to have been written at an earlier period than those passages in which he is spoken of as *Jehovah*. The Elohist paragraphs are simpler, more pastoral, and more primitive in their character than the *Jehovistic*. Gen. i. 27 is Elohist, Gen. ii. 21-24 is *Jehovistic*.

The New Testament authors followed the *Elohistic* account, and speak of him [Balaam] disparagingly. *Engc. Brd.*, III. 259.

Iamblichus makes the One to emanate from the Good, thus going one step further. The Gnostics and Cabalists pushed the doctrine to fantastic developments.

It sometimes happens that a cause causes the effect by its own existence, without any causality distinct from its existence; and this by some is called *emanative*: which word, though feigned with repugnancy to the analogy of the Latin tongue, yet is it to be used upon this occasion till a more convenient can be found out.

In a late restricted sense it includes more than 50 species, confined to the Palearctic, Indian, and Ethiopian regions. None of the very many North and South American buntings which have been called *Emberiza* properly belong to this genus. See *Emberizinae*, and cuts under *bunting* and *ciril-bunting*.

Emberizidæ (em-be-riz'i-dē), *n. pl.* [NL., < *Emberiza* + *-idæ*.] The buntings rated as a family of conirostral passerine birds.

Emberizinae (em'be-rī-zī'nē), *n. pl.* [NL., < *Emberiza* + *-inae*.] The true buntings rated as a subfamily of *Fringillidae*. The group is probably inacceptable of zoological definition. It has of late been made one of three subfamilies of *Fringillidae* (the others being *Coccothraustinae* and *Fringillinae*), having the nasal bones short, not extended backward beyond the fore border of the orbits, the mandibular tonia not continuous throughout, leaving a gap in the commissural line of the bill, and the gonysal angle well marked. In such acceptance, the *Emberizinae* include about 50 genera, of most parts of the world, represented by many of the most common buntings, finches, and 'sparrows' of English-speaking countries, especially of the United States, as the chip-, snow-, and vesper-bird, lark-linch, lark-and-towhee-bunting, black-throated bunting, white-throated and white-crowned sparrows, field-, fox-, song-, swamp-, and savannah-sparrows, the long-spurs, etc. See *Emberiza*.

Pepys, Diary, II. 159.

= **Syn. 2 and 3. Emblem, Symbol, Type.** *Emblem* and *symbol* refer to tangible objects; *type* may refer also to an act, as when the lifting up of the brazen serpent (Num. xxi. 8, 9) is said to be a *type* of the crucifixion, the serpent being a *type* or *emblem* of Christ. A *symbol* is generally an emblem which has become recognized or standard among men; a volume proposing new signs of this sort would be called a "book of emblems"; but an emblem may be a *symbol*, as the bread and wine at the Lord's supper are more often called *emblems* than *symbols* of Christ's death. *Symbol* is by this rule the appropriate word for the conventional signs in mathematics. *Emblem* is most often used of moral and religious matters, and *type* chiefly of religious doctrines, institutions, historical facts, etc. *Type* in its religious application generally points forward to an *antitype*.

Emblems thus include corn, potatoes, and most garden vegetables, but not fruits, and generally not grass. They are deemed personal property, and pass as such to the executor or administrator of the occupier, instead of going with the land to his heir, if he die before he has cut, reaped, or harvested them; they also belong to the tenant when his tenancy has been terminated by an unexpected event without his agency, as by his death or that of his landlord.

If a tenant for his own life sows the lands, and dies before harvest, his executors shall have the *emblemments*, or profits of the crop.
Blackstone, *Com.*, II. 8.

2. The right to such crops. — **Emblemments Act**, an English statute of 1851 (14 and 15 Vict., c. 25), which enacted that, instead of having a right to emblemments, a tenant under a tenant for life, on the determination of the tenancy, shall hold until the expiration of the then current year; that growing crops seized under execution shall be liable for accruing rent; that the tenant may remove his improvements unless the landlord elect to take them; and that in case a tithe-rent charge is unpaid the landlord may pay it and recover as on a simple contract.

embossing (em-bos'ing), *n.* [Verbal *n.* of *emboss¹*, *v.*] 1. The art or process of producing raised or projecting figures or designs in relief upon surfaces. A common method of embossing upon a wooden surface is by driving a blunt tool into the wood according to the desired pattern, then planing the surface down to the level of the sunken design, and afterward wetting it. The moisture causes the compressed portions forming the design to rise to their original height, and thus to project from the planed surface. Embossing on leather, paper, or cloth, as for book-covers, books for the blind, and various kinds of ornamental work, and also on metal, is usually effected by stamping with dies by means of an embossing- or stamping-press, or the bookbinders' arming-press. See *embossing-machine*.

embroidery (em-broi'dér-i), *n.*; pl. *embroideries* (-iz). [*embroider*, after *broidery*.] 1. The art of working with the needle raised and ornamental designs in threads of silk, cotton, gold, silver, or other material, upon any woven fabric, leather, paper, etc. Embroidery has been used in all ages for the decoration of hangings and garments used for statues of divinities or in religious ceremonies; but its use in ordinary dress was especially developed during the middle ages in Europe, when garments entirely ornamented with the needle were worn by those who could afford them, and heraldry offered an opportunity for embroidery upon the surcoats and tabards of men-at-arms. The nations of Persia and the extreme East are the greatest masters of embroidery in modern times. The example most familiar to the West is the India shawl, for which see *cashmere* and *chudder*.

2. A design produced or worked according to this art.

parent; a germ; a rudiment; in a more extended sense, a rudimentary animal during its whole antenatal existence. In the later stages of development, especially in man and the mammals generally, the name *fetus* commonly takes the place of *embryo*. In the cases of oviparous animals, the term *embryo* properly covers the whole course of development of the fecundated germ in the egg (which see, and see cut under *dorsal*): as, the hen's egg contained an *embryo* ready to hatch. By a late and loose, though now common, extension of the term, it is applied to various larval stages of some invertebrates, which in the course of their transformation are frequently so different from the parent as to be described as distinct species or genera: as, the *embryo* (first larval stage) of a cestoid worm.

2. In *bot.*, the rudimentary plant contained in the seed, the result of the action of pollen upon the ovule. It may be so rudimentary as to have apparently no distinction of parts; but even in its simplest form it consists virtually of a single internode of an axis, which upon germination develops at one extremity a leaf or leaves with a terminal bud, and a root at the other. In more developed embryos this initial internode or culicle (often incorrectly called *radicle*) bears at one end one, two, or more rudimentary leaves called cotyledons, and often an initial bud or plumule. Also called *germ*. By recent authors the term is also applied to the developed oospore in vascular cryptogams. See cuts under *albumen* and *cotyledon*.

2. The sovereign or supreme ruler of an empire: a title of dignity conventionally superior to that of *king*: as, the *emperor* of Germany or of Russia. See *empire*. The title *emperor*, first assumed (with consent of the senate) by Julius Caesar, was held by the succeeding rulers of the Roman, and afterward of the Western and Eastern empires. The line of emperors of the West terminated in A. D. 476, but the title was revived in 800 by Charlemagne, who thus laid the foundation of the elective Holy Roman Empire (which see, under *empire*). The last of his successors had, before his abdication in 1806, adopted the title of hereditary emperor of Austria. The king of Prussia was crowned emperor of Germany in 1871. Peter the Great of Russia assumed the title in 1721, and the ruler of Brazil in 1822; and it was held by Napoleon I. and Napoleon III. of France. In 1876 Queen Victoria of England was proclaimed *empress*

of India. In western speech the sovereigns of Turkey, China, Japan, etc., are called *emperors*.

Under existing international arrangements the crowned heads of Europe take precedence according to the date of their accession, and their rank is precisely the same, whether their style is imperial or royal. But the proper meaning of *emperor* is the chief of a confederation of states of which kings are members.

emphasis (em-fā-sis), *n.* [= *F. emphase* (> *D. G. emphase* = *Dun. enfase* = *Sw. enfus*) = *Sp. enfusis* = *Pg. emphasis* = *It. enfasi*, *emphasis*, < *L. emphasis* (in pure *L. significatio*); see *significatio*), < *Gr. ἐμφασις*, an appearing in, outward appearance, a showing or letting a thing be seen as in a mirror (reflection, image), or as involved, hence, in rhet., pregnant suggestion, indirect indication, significance, *emphasis*, < *ἐμφαίνω*, show forth, < *ἐν*, in, + *φαίνω*, show, mid. *φαίνεσθαι*, appear, > *φάσις*, phase, appearance: see *phase*.] 1. In rhet.: (a) Originally, a figure consisting in a significant, pregnant, or suggestive mode of expression, implying (especially in connection with the context or the circumstances under which an oration is delivered) more than would necessarily or ordinarily be meant by the words used. This figure is of two kinds, according as it suggests either something more than is said, or something purposely not mentioned or professedly not intended. Poets frequently employ it for the former purpose, especially in similes and epithets. (b) The mode of delivery appropriate to pregnant or suggestive expression; hence, rhetorical stress; in general, significant stress; special stress or force of voice given to the utterance of a word, succession of words, or part of a word, in order to excite special attention. Emphasis on a syllable differs from syllabic accent by being exceptional in use, and altering the ordinary pronunciation of the word, either by increasing the stress on the syllable regularly accented or by transferring the accent to another syllable: as, a sin may be a sin of omission or a sin of commission (instead of omission, commission).

The province of *emphasis* is so much more important than that of accent that the customary seat of the latter is transferred in any case where the claims of *emphasis* require it. E. Porter, Rhetorical Delivery, iv.

2. Special and significant vigor or force: as, *emphasis* of gesticulation; in general, significance; distinctiveness.

External objects stand before us . . . in all the life and *emphasis* of extension, figure and colour.

Sir W. Hamilton.

=**Syn.** 1. *Emphasis*, *Accent*, *Stress*. *Emphasis* is generally upon a word, but may be upon a combination of words or a single syllable. *Accent* is upon a syllable: as, the place of the accent in the word "demonstrate" is not fixed. *Stress* is a synonym for either *emphasis* or *accent*. See *inflection*.

That voice all modes of passion can express
Which marks the proper word with proper stress;
But none emphatic can that speaker call
Who lays an equal emphasis on all. Lloyd.

By increasing, therefore, the degree of habitual accent on a given syllable, we can render emphatic the word in which it occurs. G. L. Raymond, Orator's Manual, § 27.

Uttered, or to be uttered, with emphasis or stress of voice: as, the *emphatic* words in a sentence.—2. Forcibly significant; expressive; impressive: as, an *emphatic* gesture.

It was usually for a perpetual term, thus corresponding to the feudal fee.

We are told that with the municipalities began the practice of letting out agri vectigales, that is, of leasing land for a perpetuity to a free tenant, at a fixed rent, and under certain conditions. The plan was afterwards extensively imitated by individual proprietors, and the tenant, whose relation to the owner had originally been determined by his contract, was subsequently recognised by the Praetor as having himself a qualified proprietorship, which in time became known as *emphyteusis*. Lowell, *Among my Books*, 1st ser., p. 244.

2. The country, region, or union of states or territories under the jurisdiction and dominion of an emperor or other powerful sovereign or government; usually, a territory of greater extent than a kingdom, which may be, and often is, of small extent: as, the Roman or the Russian empire. The designation *empire* has been assumed in modern times by some small or homogeneous monarchies, generally ephemeral; but properly an empire is an aggregate of conquered, colonized, or confederated states, each with its own government subordinate or tributary to that of the empire as a whole. Such were and are all the great historical empires; and in this sense the name is applied appropriately to any large aggregation of separate territories under one monarch, whatever his title may be: as, the Assyrian, Babylonian, and Persian empires; the empire of Alexander the Great; the British empire, etc. See *emperor*, and *Holy Roman Empire*, below.

3. Supreme control; governing influence; rule; sway: as, the empire of reason or of truth.

We disdain To do those servile offices, oft-times His foolish pride and empire will exact.

B. Jonson, *Magnetic Lady*, iii. 4.

The sword turns preacher, and dictates propositions by empire instead of arguments.

Jer. Taylor, *Works* (ed. 1835), I. 690.

It is to the very end of our days a struggle between our reason and our temper, which shall have the empire over us.

Steele, *Tatler*, No. 172.

Circle of the empire. See *circle*.—**Eastern Empire, or Empire of the East**, originally, that division of the Roman empire which had its seat in Constantinople. Its final separation from the Western Empire dates from the death of Theodosius the Great (A. D. 395), whose sons Arcadius and Honorius received respectively the eastern and western divisions of the Roman dominion. After the fall of the Western Empire, the Empire of the East is commonly known as the *Byzantine Empire*. It continued until the capture of Constantinople by the Turks in 1453.—**Empire City**, the city of New York: so called as being the chief city of the Empire State, and the commercial metropolis of the United States.—**Empire State**, the State of New York: so called from its superior population and wealth as compared with the other States of the Union.—**Holy Roman Empire**, the German-Roman empire in western and central Europe (in later times commonly styled the *German Empire*), which, after a lapse of more than three hundred years, reunited a large portion of the territories formerly belonging to the Western Empire. The union of the German royal and Roman imperial crowns began with Charles the Great or Charlemagne, king of the Franks, who was crowned emperor by the Pope at Rome A. D. 800; but the line of German kings who were at the same time Holy Roman emperors begins properly with Otto the Great, crowned emperor in 962. The empire was regarded as the temporal form of a theoretically universal dominion, whose spiritual head was the Pope, and the earlier emperors were crowned at Rome by the spiritual rulers of Christendom. The empire continued under monarchs of the Saxon, Franconian, and Hohenstaufen dynasties, passing in 1273 to the Austrian house of Hapsburg, the members of which line remained in uninterrupted possession of the empire from 1438 until its final extinction in 1806. It had long previously lost the greater part of the external territories which had entitled it to be called Roman; and its final dissolution was due to the conquests and encroachments of Napoleon I. (See *emperor*). The emperors were elected by certain of the more powerful German princes called electors, whose number was definitely fixed at seven by the Golden Bull of 1356, and remained at that number with but slight changes.—**The Celestial Empire**. See *celestial*.

Western Empire, the distinctive designation of the western portion of the Roman world after its division into two independent empires in A. D. 395. (See *Eastern Empire*, above.) Its power very rapidly declined under the incursions of barbarians and other adverse influences, and it was finally extinguished in A. D. 476.—**Syn. 1.** Sway, dominion, rule, reign, government, supremacy.

empirema (em-pi-ré-má), *n.*; pl. *empiremata* (em-pi-ré-má-tá). [NL., < Gr. as if *ἐμπειρία*, < *ἐμπερι-* + *πειρα*, experienced in, < *ἐμπεριος*, experienced: see *empiric*.] In logic, a proposition grounded upon experience. Also spelled *empeirema*.

empiric (em-pir'-ik), *a.* and *n.* [Formerly *em-pirick*; < OF. *empirique*, F. *empirique* = Sp. *empirico* = Pg. It. *empirico* (cf. D. G. *empirisch* = Dan. Sw. *empirisk*), < L. *empiricus*, < Gr. *ἐμπειρος*, experienced (oi *ἐμπειρικοί*, the Empirics: see II., 1), < *ἐμπερία*, experience, mere experience or practice without knowledge, esp. in medicine, *empiricism*, < *ἐμπειρία*, experienced or practised in, < *ἐν*, in, + *πειρα*, a trial, experiment, attempt; akin to *πέρος*, a way, < **περ-*

**παρ* = E. *fare*, go.] I. *a.* 1. Same as *empirical*.—2. Versed in physical experimentation: as, an *empiric* alchemist.—3. Of or pertaining to the medical empirics.

It is accounted an error to commit a natural body to *empiric* physicians. Bacon, *Advancement of Learning*, I. 17.

II. *n.* 1. [*cap.*] One of an ancient sect of Greek physicians who maintained that practice or experience, and not theory, is the foundation of the science of medicine.

Among the Greek physicians, those who founded their practice on experience called themselves *empirics*; those who relied on theory, methodists; and those who held a middle course, dogmatists.

Fleming, *Vocab. of Philos.* (ed. Krauth), p. 157.

2. An experimenter in medical practice, destitute of adequate knowledge; an irregular or unscientific physician; more distinctively, a quack or charlatan.

It is not safe for the Church of Christ when bishops learn what belongeth unto government, as *empirics* learn physic, by killing of the sick. Hooker, *Eccles.* Polity, vi. 24.

This is the cause why *empirics* and old women are more happy many times in their cures than learned physicians, because they are more religious in holding their medicines. Bacon, *Advancement of Learning*, II. 198.

There are many *empiricks* in the world who pretend to infallible methods of curing all patients.

Bp. Atterbury, *Sermons*, II. viii.

Empiricks and mountebanks.

Shaftebury, *Advice to an Author*, ii. § 2.

3. In general, one who depends mainly upon experience or intuition; one whose procedure in any field of action or inquiry is too exclusively empirical.

The *empiric*, . . . instead of ascending from sense to intellect (the natural progress of all true learning), . . . hurries, on the contrary, into the midst of sense, where he wanders at random without any end, and is lost in a labyrinth of infinite particulars. Harris, *Hermes*, iv.

Vague generalisations may form the stock-in-trade of the political *empiric*, but he is an *empiric* notwithstanding. Stubbs, *Medieval and Modern Hist.*, p. 91.

—**Syn. 2.** Mountebank, etc. See *quack*, *n.*

empirical (em-pir'-i-kal), *a.* [*< empiric + -al.*]

1. Pertaining to or derived from experience or experiments; depending upon or derived from the observation of phenomena.

In philosophical language the term *empirical* means simply what belongs to or is the product of experience or observation. Sir W. Hamilton.

Now here again we may observe the error into which Locke was led by confounding the cause of our ideas with their occasion. There can be no idea, he argues, prior to experience; granted. Therefore he concludes the mind previous to it is, as it were, a tabula rasa, owing every notion which it gains primarily to an *empirical* source. J. D. Morell.

The *empirical* generalization that guides the farmer in his rotation of crops serves to bring his actions into concord with certain of the actions going on in plants and soil. H. Spencer, *Prin. of Biol.*, § 28.

2. Derived, as a general proposition, from a narrow range of observation, without any warrant for its exactitude or for its wider validity.

The *empirical* diagram only represents the relative number and position of the parts, just as a careful observation shows them in the flower; but if the diagram also indicates the places where members are suppressed, . . . I call it a theoretical diagram. Sachs, *Botany* (trans.), p. 523.

It is not at all impossible that Henry II. may have been among the pupils of Vacarius: certainly he was more of a lawyer than mere *empirical* education could make him. Stubbs, *Medieval and Modern Hist.*, p. 303.

3. Pertaining to the medical practice of an empiric, in either of the medical senses of that word; hence, charlatanical; quackish.

The *empirical* treatment he submitted to . . . hastened his end. Goldsmith, *Bolingbroke*.

Empirical certainty, cognition, ego, idealism, etc. See the nouns.—**Empirical formula or law**, a formula which sufficiently satisfies certain observations, but which is not supported by any established theory or probable hypothesis, so that it cannot be relied upon far beyond the conditions of the observations upon which it rests. Thus, the formula of Dulong and Petit expressing the relation between the temperature of a body and its radiative power cannot be extended to the calculation of the heat of the sun, since there is no reason for supposing that it would approximate to the truth so far beyond the temperatures at which the experiments were made.

empirically (em-pir'-i-kal-i), *adv.* In an empirical manner; by experiment; according to experience; without science; in the manner of quacks.

Every science begins by accumulating observations, and presently generalizes these *empirically*.

H. Spencer, *Data of Ethics*, § 22.

empiricism (em-pir'-i-sizm), *n.* [*< empiric + -ism.* See *empiric*.] 1. The character of being empirical; reliance on direct experience and observation rather than on theory; empirical method; especially, an undue reliance upon mere individual experience.

He [Radcliffe] knew, it is true, that experience, the safest guide after the mind is prepared for her instructions by previous institution, is apt, without such preparation, to degenerate to a vulgar and presumptuous *empiricism*. F. Knox, *Essays*, xxxviii.

At present, he [Bacon] reflected, some were content to rest in *empiricism* and isolated facts, others ascended too hastily to first principles. F. A. Abbott, *Bacon*, p. 344.

What is called *empiricism* is the application of superficial truths, recognized in a loose, unsystematic way, to immediate and special needs. L. F. Ward, *Dynam. Sociol.*, II. 203.

2. In med., the practice of empirics; hence, quackery; the pretension of an ignorant person to medical skill.

Shudder to destroy life either by the naked knife or by the surer and safer medium of *empiricism*. Dought.

3. The metaphysical theory that all ideas are derived from sensuous experience—that is, that there are no innate or a priori conceptions.

The terms *Empiricism*, *Empiricist*, *Empirical*, although commonly employed by metaphysicians with contempt to mark a mode of investigation which admits no higher source than experience (by them often unwarrantably restricted to Sensation), may be accepted without demur, since even the flavor of contempt only serves to emphasize the distinction. G. H. Lewes, *Probs. of Life and Mind*, I. ii. § 14.

empiricist (em-pir'-i-sist), *n.* [*< empiric + -ist.*]

1. One who believes in philosophical empiricism; one who regards sensuous experience as the sole source of all ideas and knowledge.

Berkeley, as a consistent *empiricist*, saw that Sensation shuts itself up within its own home, and does not include its object. The object must be supplied from without, and he supplied it provisionally by the name of God. N. A. Rev., CXX. 409.

The *empiricist* can take no cognizance of anything that transcends experience. New Princeton Rev., II. 109.

2. A medical empiric.

empirictic, empiricutic (em-pi-rik'tik, em-pir-i-ku'tik), *a.* [An unmeaning extension of *empiric*.] Empirical.

empiristic (em-pi-ris'tik), *a.* Of or pertaining to empiricism or to the empiricists; empirical. [Rare.]

(a) That kind of solid masonry in regular courses in which the courses are formed alternately entirely of blocks presenting one of their sides to the exterior and entirely of blocks presenting their ends to the exterior.

Sometimes the (Etruscan) wall is built in alternate courses, in the style which has been called *empectrum*, the ends of the stones being exposed in one course, and the sides in the other. *G. Ravennae, Orig. of Nations, l. 114.*

(b) That kind of masonry, much used in ancient fortification walls, etc., in which the outside surfaces on both sides are formed of ashlar laid in regular courses, and the inclosed space between them is filled in with rubble work, cross-stones being usually placed at intervals, either in courses or as ties extending from face to face of the wall, and binding the whole together. The term is, however, a loose one, and can be applied to any sort of masonry of greater thickness than the width of a single block, and so laid that the wall is bound together by some regular alternation of blocks placed lengthwise and endwise. Macaulay, Sir J. Mackintosh.

=Syn. 2. Employ, Hire. Hire and employ are words of different meaning. To hire is to engage in service for wages. The word does not imply dignity; it is not customary to speak of hiring a teacher or a pastor; we hire a man for wages; we employ him for wages or a salary. To employ is thus a word of wider signification. A man hired to labor is employed, but a man may be employed in a work who is not hired; yet the presumption is that the one employing pays. Employ expresses continuous occupation more often than hire does.

A genus of lepidopterous insects. *Hübner*, 1816.—3. In *bot.*, the principal genus of *Entomophthoraceae*, including, as now understood, the species formerly referred to the genus *Entomophthora*. The species are parasitic upon insects. That upon the common house-fly is the one most frequently observed, forming a white halo of spores around dead flies adhering to window-panes in autumn. Spores of an *Empusa*, coming in contact with a suitable insect, enter it by means of hyphal germination and grow rapidly till the insect is killed, forming sometimes mycelium, but commonly, by budding, detached hyphal bodies of spherical or oval form. When the conditions are unfavorable to further growth the hyphal bodies may be transformed into chlamydospores, but under favorable conditions of moisture the hyphal bodies

or chlamydospores produce hyphae. At the tip of each is formed a single conidium in a sporangium similar to that of *Mucor*; or, instead of conidia, thick-walled and spherical resting spores may be formed, either asexually or by conjugation. Twenty-six species are now known in the United States, growing upon insects of all the hexapod orders.

= **Syn. 1 and 2.** *Emulation, Competition, Rivalry.* The natural love of superiority is known as emulation; in common use the word signifies the desire and the resulting endeavor to equal or surpass another or others in some quality, attainment, or achievement. It is intrinsically neutral both as to time and motive, but it is most frequently applied to the relations of contemporaries or associates, and to feelings and efforts of an honorable nature. *Competition* is the act of striving against others; the word is used only where the object to be attained is pretty clearly in mind, and that object is not mere superiority, but some definite thing: as, competition for a prize; competition in business. *Rivalry*, unless qualified by some favorable adjective, is generally a contest in which the competitors push their several interests in an ungenerous spirit, malignant feelings being easily a result. *Rivalry* may be general in its character: as, the rivalry between two states or cities; in such cases it may be friendly and honorable.

A noble emulation heats your breast. *Dryden.*

There are about 60 species, of numerous genera, agreeing in their hard shell, well-formed feet adapted both for walking and swimming, usually 5-toed before and 4-toed behind, and furnished with claws. They inhabit northern temperate and tropical regions, within which they are widely distributed.

A few occur in salt or brackish water. The leading genera are *Emys*, *Cistuda* (the box-tortoises), *Chelonia* (the speckled turtles), etc. The salt-water terrapin of the Atlantic States, *Malacochelone palustris*, well known to epicures, belongs to this family. By some the name is supplanted by *Clemmydidae*, the genus *Emys* being referred to the family *Cistudinidae*, and by others the family is considered to be inseparable from the *Testudinidae*. (b) Restricted to certain box-tortoises belonging to the family now called *Cistudinidae*, such as the box-tortoise of Europe, *Emys europaea*, which is the *emys* of Aristotle and the ancients, and the *Emys blandingi* of North America.

en (en), *n.* [*ME.* *en, < *AS.* *en, < *L.* en, < *e*, the usual assistant vowel, + *n*.] 1. The name of the letter *N*, *n*. It is rarely written, the symbol *N*, *n*, being used instead.—2. In *printing*, a space half as wide as an *em*, sometimes used as a standard in reckoning the amount of a compositor's work. See *em*¹, 2.

en-1. [*ME.* en-, < *OF.* en-, rarely *F.* en- = *Sp.* Pg. en- = *It.* en-, in-, < *L.* in- (see in-2), an adverbial or prepositional prefix, conveying the idea, according as the verb is one of rest or of motion, of existence 'in' a place or thing, or of motion, direction, or inclination 'into' or 'to' a place or thing, < *in*, prep., in, into, = *E.* in: see in¹. In later *L.* in- usually became im-, and so in *Rom.* en- usually becomes em-, before labials: see em-1, im-2.] A common adverbial or prepositional prefix, representing Latin in-, meaning primarily 'in' or 'into.' Appearing first in Middle English words derived through Old French from Latin, en-1 (before labials em-) has come to be freely used as a prefix of words of native as well as of Romance or Latin origin, being equivalent to in-1 of pure English origin and to in-2 of direct Latin origin, and hence often restored to the pure Latin form. Hence forms in en-1 (em-1) and in-2 (im-2) are frequently found (even in Middle English) co-existing, as *enclowse*, *inclose*, *enquire*, *inquire*, *enwrap*, *inwrap*, *enfold*, *infold*, with, however, a tendency in one or other of the forms to disappear, or to become partly differentiated in use. Before labials en- becomes em-, as in *embellish*, *embrace*, but may remain unchanged before *m*, as in *emnew* or *emnew*. As a verbal prefix, en-, when joined to a noun, or a verb from a noun, may retain its original meaning of 'in' ('put in'), as in *enrage* (put in a cage), *enfold*, *enfetter*, *encapsule*, etc.; or when prefixed to an adjective or a noun, it may denote a change from one state into another ('make . . .'), as in *enable* (make able), *enrich*, *enlarge*, *enfranchise*, *enlarge*, and hence has often the effect simply of a verb-forming prefix. In some cases, prefixed to a verb, it has no additional force, as in *enkindle*, *enactuate*.

en-2. [*F.*, etc., en-, < *L.* en-, < *Gr.* ἐν- (before gutturals ἐν-), a prefix conveying with verbs the idea of 'in' or 'at' a place, etc., with adjectives the possession of a quality, 'having,' 'with,' 'in'

(= *L.* in-, > en-1, above), < ἐν, prep., = *L.* in = *E.* in: see in¹.] An adverbial or prepositional prefix of Greek origin, meaning primarily 'in': chiefly in scientific or technical words of modern formation, as in *encephalon*, *enanthema*, etc.

en-1. [(1) *ME.* -en (sometimes spelled -in, -yn), later often -e, the two forms long coexisting; earliest *ME.* always -en (weak verbs -en or -ien), < *AS.* -an (weak verbs -an or -ian, -igean), *ONorth.* -a, -ia = *OS.* -an (-ōn) = *OFries.* -a = *D.* -en = *OHG.* -an (-ēn, -ōn), *MHG.* G. -en = *Icel.* -a (-ja) = *Sw.* -a (-ja) = *Dan.* -e = *Goth.* -an (-jan), the reg. Teut. inf. suffix, quite different from the *L.* inf. suffix, -re (-ā-re, -ē-re, -ō-re, -i-re), but cognate with *Gr.* -ειν, later reg. -ειν, and orig. dat. of *ana, an orig. noun suffix. (2) *ME.* -en, often only -e. < *AS.* -en = *OS.* -an = *OFries.* Fries. MD. D. MLG. LG. -en = *OHG.* -an, *MHG.* G. -en = *Icel.* -inn = *Sw.* Dan. -en = *Goth.* -an-s, the reg. pp. suffix of strong verbs, = *L.* -nus = *Gr.* -νός = *Skt.* -nas, an adj. suffix. (3) < *ME.* -en-en, -en-en (the final syllable being a different suffix, -en¹ (1)), < *AS.* -n-an, -n-ian (as in *fastnian*, > *E.* fasten, make fast) = *Goth.* -n-an, prop. intr., as in *Goth.* fullnan, become full, in verbs formed on the pp. of strong verbs, -an-s = *AS.* and *E.* -en, etc. See (2), above. (4) *ME.* -en, often -e, in later *ME.* a general pl. suffix, in earlier *ME.* confined to ind. and subj. pret. pl. and subj. pres., the ind. pres. (and impv. pl.) having -eth, < *AS.* -ath, -iath. The *AS.* verb-forms with pl. term. -n were (in all 3 persons) subj. pres. -en (-ien), ind. pret. -on (-an), subj. -en. Like forms are found in the other Teut. tongues, being worn-down and assimilated forms of elements orig. of different origin.] A termination of various origin, used in the formation of verbs. (a) The infinitive suffix, now obsolete, as in Middle English *singen*, *escapen*, *pullen*, etc., modern English *sing*, *escape*, *pull*, etc. In late Middle English the -n fell away (*singe*, *escapen*, *pullen*, etc.), but the -e continued to be pronounced, at least optionally, until near the end of the Middle English period; in modern English the -e, though always silent, is retained in spelling after a single consonant following a long vowel (as in *escape*) and in some other positions. (b) The suffix of the past participle of strong verbs (Middle English and Anglo-Saxon -en), as in *risen*, *written*, etc., past participles of *rise*, *write*, etc. In Middle English the -n often fell away (*risen* or *rise*, *written* or *write*, etc.); hence in modern English many coexisting forms in -en and -e silent or absent, as *broken* and *broke*, *written* and *writ*, *beaten* and *beat*, *sunken* and *sunk*, etc. In most of these pairs there is a slight differentiation of use (as *sunken*, *drunken*, adj., *sunk*, *drunk*, pp.), or one form is obsolete (*writ*, pp., etc.) or regarded as "incorrect" (*broke*, *spoke*, etc.), or is merely vulgar (*riz* for *risen*, etc.). In some cases the past participle in -en is modern, the verb being originally weak (with past participle in -ed²), as in *worn*, pp. of *wear*. In most of such instances the older form in -ed² is still in prevalent use, as in *sewed* or *sewn*, *saved* or *swim*, *proved* or *proven*, etc., the -ed² being in some instances absorbed, as in *hid* or *hidden*, *chid* or *chidden*. (c) A suffix forming verbs from adjectives, as *weaken*, *fatten*, etc. Originally such verbs were only intransitive ('become weak, fat, etc.'), but now they are also transitive ('make weak, fat, etc.'). (d) In Middle English, a plural suffix of verbs: as, they *aren*, *veren*, *ayen*, *nyngen*, *eyngen*, etc. It is now reduced to silent -e or entirely lost.

en-2. [*ME.* -en, < *AS.* -en = *D.* -en = *OHG.* *MHG.* G. -en, etc., = *Goth.* -in-s, -ein-s = *L.* -nu-s = *Gr.* -νός = *Skt.* -na-s, an adj. suffix, radically identical with en-1 (2), pp. suffix.] A suffix forming adjectives from nouns of material, as *ashen*¹, *ashen*², *earthen*, *oaken*, *wooden*, *golden*, sometimes simply -n, as *cedarn*, *eldern*, *silvern*, etc. Many such words are obsolete, dialectic, or archaic, as *elmen*, *treem*, *clayen*, *havi*, etc.; many are also, some chiefly or exclusively, nouns, as *arsen*, *linden*, *linen*, *woolen*.

en-3. [*ME.* -en, < *AS.* -en (gen. dat. -enne), earlier -in-, -inne = *OHG.* -in (-inna), *MHG.* -in-, -inne, G. -in = *L.* -ina (as in *regina*, queen) = *Gr.* -ιννα, -a-ιννα = *Skt.* -ānt, fem. suffix.] A feminine suffix, of which only a few relics exist in native English words, as, for example, *vixen*, from Anglo-Saxon *fyxen* (= German *fuchsin*), a female fox: in some instances regarded as having a diminutive force, as in *maiden*, from Anglo-Saxon *maegen*, etc. See *vixen*, *maiden*, and compare *elfin*.

en-4. [*ME.* -en, often -e, and, with double pl., -en-e, < *AS.* -an, the nom. acc. pl. the termination is of Middle English origin, except in *oxen* (from Anglo-Saxon *ocean*), *eyne*, *een* (from Anglo-Saxon *edgan*), *hosen* (from Anglo-Saxon *hosan*), *peasen* (from Anglo-Saxon *peasan*).

en-5. A suffix of various other origins besides those mentioned above: often ultimately identical with -an (Latin -anus), as in *citizen*, *denizen*, *dozen*, etc., but having also, as in *often*, *midden*, etc., other sources ascertainable upon reference to the word concerned.

It was described by Seeley in 1886 under the name *Pelagornis* (*P. barretti*), which, being preoccupied by *Pelagornis* of Lartet (1857), was renamed *Enaliornis* by Seeley in 1889. The remains appear to be those of a true bird, resembling a penguin in some respects.

Enaliosauria (e-nal-i-ô-sâ-ri-â), *n. pl.* [*NL., < Gr. ἐνάλιος, living in the sea (< ἐν, = E. in, + ἄλις, the sea), + σαῦρος, lizard.*] A superordinal group of gigantic aquatic Mesozoic reptiles, with a very long body, naked leathery skin, paddle-like limbs, numerous teeth in long jaws, and biconcave vertebrae. The group contained the ichthyosaurs, plesiosaurs, and other marine monsters now placed in different orders. The term is now little used; it sometimes, however, still covers the two current orders *Ichthyosauria* and *Plesiosauria*, or *Ichthyopterygia* and *Sauropterygia*.

It. enallage*, *< L. enallage*, *< Gr. ἐναλλαγή, an interchange, < ἐναλλάσσειν, interchange, < ἐν, in, + ἀλλάσσειν, change, < ἄλλος, other: see allo-.*] In *gram.*, a figure consisting in the substitution of one form, inflection, or part of speech for another. Special names are given to subdivisions of this figure. The substitution of one part of speech for another is *antimeria*; that of one case for another is *antiphrasis*. Interchange of the functions of two cases in one phrase is a form of *hypallage*. Enallage of gender can hardly be illustrated in English. Antiphrasis is exemplified in the colloquial "It's me" for "It's I." Enallage of number is seen in the royal and literary "we" for "I," and in our modern established "you" for "thou."

Not changing one word for another, by their accidents or cases, as the *Enallage*.

enamel (e-nam'el), *n.* [*< ME. enamele (with prefix en-, due to the verb enamelen), prop. *amaile, amel, amell, amelle, amall, amayl, later amnell (> D. G. email = Dan. emaille = Sw. email), < OF. esmail, F. émail, enamel: see amel.*] 1. In *ceram.*, a vitrified substance, either transparent or opaque, applied as a coating to pottery and porcelain of many kinds. It is simply a fusible kind of glass, and when transparent is commonly called *glaze*. A vitreous coating of similar character is applied to a class of iron utensils for cooking, etc., and is made to serve other useful purposes.

2. In the *fine arts*, a vitreous substance or glass, opaque or transparent, and variously colored, applied as a coating on a surface of metal or of porcelain (see def. 1) for purposes of decoration. It consists of easily fusible salts, such as the silicates and borates of sodium, potassium, lead, etc., to which various earths and metallic oxides are added to give the desired colors. These enamels are now prepared in the form of sticks, like sealing-wax, and for use are pulverized, and applied to the surface either dry or moistened so as to form a paste. The object to be enameled is then exposed to a moderate temperature in a muffle, and the vitreous substance becomes sufficiently fluid to form a brilliant and adhesive coating. Enamels in modern times include an infinite number of tints; but those of the ancient Orientals and of the Byzantine empire present but few colors, and those distinctly contrasting. See def. 3, and *Limoges enamel*, below.

3. **Enamel-work**: a piece or sort of work whose chief decorative quality lies in the enamel itself: as, a fine piece of cloisonné enamel; a specimen of enamel à jour. Of this work there are three distinct classes: (1) *cloisonné enamel*, in which partitions surrounding the compartments of enamel of each different color are formed of wire of rectangular section secured to the body or foundation; (2) *champlevé enamel*, in which the surface of the background is engraved or hollowed out to receive the enamel; (3) *surface-enamel*, in which the

whole surface of a plate of metal is covered with the enamel, which when fused affords a smooth ground for painting. A familiar instance of the last kind of enamel-work is the dial of a common watch, which is enameled on copper in white, the figures being painted upon it in black enamel. Champlevé enamel is most used for jewelry and similar decorative work.

About her necke a sort of faire rubies

The Assembly of Ladies, l. 534.

4. Any smooth, glossy surface resembling enamel, but produced by means of varnish or lacquer, or in some other way not involving vitrification: as, the enamel of enameled leather, paper, slate, etc.—5. In *anat.*, the hardest part of a tooth; the very dense, smooth, glistening substance which crowns a tooth or coats a part of its surface: distinguished from *dentin* and from *cement*. It is always superficial, and represents a special modification of epithelial substance. It is usually white, sometimes red, as in the front teeth of most rodents, or reddish-black, as in the teeth of most shrews. See *cut under tooth*.

All the bones of the body are covered with a periosteum, except the teeth; where it ceases, and an enamel of ivory, which saws and files will hardly touch, comes into its place.

7. In *cosmetics*, a coating applied to the skin, giving the appearance of a beautiful complexion.—**Battersea enamel**, a kind of surface-enamel produced in Battersea, London, in the eighteenth century. See def. 3, and *champlevé*.—**Cloisonné enamel**. See def. 3, and *cloisonné*.—**Enamel à jour**, a kind of enamel in which there is no background, the enamel being made to fill all the space between the narrow bars or wires which form the design. Such enamel when translucent shows as a pattern seen by transmitted light.**

Enamel-columns, the minute six-sided prisms of which the enamel of the teeth is composed. Also called *enamel-prisms*, *enamel-oids*, and *enamel-fibers*.—**Enamel-cuticle**, a thin horny cuticle covering the outer surface of the enamel in unworn teeth. Also called *Nasmyth's membrane* and *cuticula dentis*.—**Enamel en basse taille**, a variety of champlevé enamel in which the background of the lowered or sunken parts is sculptured with figures in relief, the enamel itself being transparent to allow them to be seen.—**Enamel en taille d'épargne**, a variety of champlevé enamel in which the field is almost wholly cut away or hollowed out for the reception of the enamel, leaving only narrow dividing lines of the metallic background.—**Flocced enamel**, enamel used for ornamenting a glass surface which has been made dull by grinding or by the use of acid.—**Glass enamel**, an opaque or semi-opaque glass having a milky appearance, due to the addition of binoxid of tin. It is used for window transparencies and "porcelain" lamp-shades.—**Incrustated enamel**, disks or similar small flat pieces of enameled metal inlaid in a larger surface, as of chased metal or filigree.—**Limoges enamel**, a variety of surface-enamel produced especially at Limoges in France, in which vessels and decorative pieces of various kinds and sizes are ornamented with pictorial subjects painted in many colors and in gold. This work reached its greatest excellence at the time of the Renaissance.

As now used by some authors, the family is restricted to fistulatus *enocrinoids* with a dicyclic base, basal plates with well-developed axial canal, brachials of two pieces, and generally without anal plates. Abbreviated *enc., ency., encyc.*
French Encyclopædia (*Encyclopédie* on *Dictionnaire raisonné des sciences*, etc.), a celebrated French work in 28 folio volumes (including 11 volumes of plates), the first of which appeared in 1751 and the last in 1785. The chief editor was Diderot, who was assisted by D'Alembert, and many of the great contemporary literary men of France (hence called the *encyclopédistes*) contributed to it. Cf. the like-formed Gr. *ἐνδογενής*, born in the house.] A plant belonging to one of the large primary classes into which the vegetable kingdom is divided: so named from the belief that the fibrovascular bundles were developed only about the center of the stem, in distinction from the *exogens* or "outside growers"; a monocotyledon. In their structure the endogens differ from the exogens chiefly in the absence of a cambium layer and in the course of the vascular bundles, which, instead of being parallel to each other in successive concentric rings, have a variously oblique or curved direction, crossing each other, and forming a stem which has ordinarily no distinction of pith or bark, and in cross-section shows the bundles irregularly disposed, either scattered over the whole surface or gathered more compactly toward the circumference. The other organs of the plants are also characteristic.

The leaves are generally parallel-veined, the flowers usually have three organs in each whorl, the seed has an embryo with one cotyledon, and the radicle issues from a sheath and is never developed into a tap-root in germination. The endogens are divided into 34 natural orders, including about 1,500 genera and from 18,000 to 20,000 species. By the characters of the inflorescence they are also distinguished as either spadicoseous, as in the *Palmeae* and *Araceae*, petaloidaceous, as in the *Orchidaceae*, *Liliaceae*, *Iridaceae*, and *Anaryllidaceae*, or glumaceous, as in the *Gramineae* and *Cyperaceae*. These 8 orders embrace over four fifths of the whole number of species, the *Orchidaceae* alone including nearly 5,000. This class contains many of the most valuable food-producing plants of the vegetable kingdom, such as the cereals and forage-plants among the grasses, the palms, plantains, etc.; and the petaloidaceous division supplies also very many of the most showy ornaments of the garden and greenhouse.

The structure of the roots of *endogens* and *exogens* is essentially the same in plan with that of their respective stems. *W. B. Carpenter*, *Micros.*, § 375.

The Protozoa are divisible into a lower and a higher group. . . . In the latter—the *Endoplastica*—a certain portion of this substance [protoplasm] (the so-called nucleus) is distinguishable from the rest. [Note] I adopt this distinction as a matter of temporary convenience, although I entertain great doubt whether it will stand the test of further investigation. (Huxley, Anat. Invert., p. 73.)

The floor of the thoracic cavity [of the crayfish] is seen to be divided into a number of incomplete cells, or chambers, by . . . apodemal partitions, which . . . arise partly from the intersternal, partly from the interepimeral mem-

brane connecting every pair of somites. The former portion of each apodeme is the endosternite, the latter the endopleurite. . . . The endopleurite . . . divides into three apophyses, one descending or arthrodial, and two which pass nearly horizontally inwards.

Both endopodite and exopodite are parts borne upon that part which is called the *protopodite*, and both are variously modified in different parts of the body of the same animal. The epipodite may become a gill, etc. The endopodite becomes in the thoracic region an ambulatory limb, and is then the ordinary "leg" or "claw" of a crab or lobster. When thus fully developed, it consists of 7 joints. These are the coxopodite, basipodite, ischiopodite, meropodite, carpopodite, propodite, and dactylopodite, named from base to tip of the leg, in Milne-Edwards's and Huxley's nomenclature. The uippers or chela at the end of such a developed endopodite are the sixth and seventh of its joints, namely, the propodite and its movably apposeable dactylopodite.

A, Developed Endopodite, or ordinary ambulatory leg of the crustacean; B, coxopodite; C, basipodite; D, ischiopodite; E, meropodite; F, carpopodite; G, propodite; H, dactylopodite; I, filaments borne on coxopodite; J, an epipodite. which lies within the integument, and is covered by flesh and skin, as distinguished from the *exoskeleton*. In man and nearly all other mammals it constitutes the whole skeleton. In invertebrates the term covers any hard interior framework supporting soft parts, as the apodermal system of arthropods, the cuticle of a squid, etc. The endoskeleton of vertebrates is divisible into two independent portions: the *axial endoskeleton*, belonging to the head and trunk, and the *appendicular endoskeleton*, to the limbs. The axial endoskeleton consists of the entire series of vertebral and cranial segments, including ribs, breast-bones, hyoid bones, and jaws. The appendicular endoskeleton consists of the bones of the limbs, regarded as diverging appendages, and inclusive of the pectoral and pelvic arches (shoulder- and hip-girdles), by which these appendages are attached to the axial elements.

The general phenomenon of the interdiffusion of fluids through septa, including both endosmosis and exosmosis, is termed *diomosis* or *osmosis*, but *endosmosis* is also used in this sense. The phenomena differ from diffusion proper in being affected by the nature of the septum.—**Electrical endosmosis**, the cataphoric action of the electric current; the passage of an electrolyzed liquid through a diaphragm from the anode to the cathode. Some of the laws of the phenomenon have been made out, although it is not fully understood. The amount which passes is proportional to the intensity of the current and to the specific resistance of the liquid, and is independent of the area and thickness of the diaphragm. The hydrostatic pressure required to present the phenomenon is proportional to the thickness and inversely as the area of the diaphragm.

endosmotic (en-dos-mō'tik), *a.* An incorrect form for *endosmotic* or *endosmic*.

First comes, of course, the creation of matter, its chaotic or nebulous condition, and the *energizing* of it by the brooding spirit. Science, III. 600.

II. *intrans.* To act with energy or force; operate with vigor; act in producing an effect.

Those nobler ecstasies of *energizing* love, of which flesh and blood, the animal part of us, can no more partake than it can inherit heaven. Horsey, Works, III. xxv.

energizer (en'ér-jiz-er), *n.* One who or that which gives energy, or acts in producing an effect. Also spelled *energiser*.

energumen (en-ér-gū'men), *n.* [= F. *énergumène* = Sp. *energumeno* = Pg. It. *energumeno*, *< L. energumenus*, *< Gr. ἐνεργούμενος*, ppr. pass. of *ἐνεργέω*, effect, execute, work on: see *energetic*, *energy*.] One possessed by an evil spirit; a demoniac. In the early church the *energumens* were officially recognized as a separate class, to be benefited spiritually and mentally by special prayer for them, frequent benediction, and daily imposition of the exorcist's hands.

There have been also some unhappy sectaries, viz.: Quakers and Seekers, and other such *Energumens* (pardon me, reader, that I have thought them so), which have given ugly disturbances to these good spirited men in their temple-work. C. Mather, Mag. Chris., I. 3.

The Catechumens, *Energumens*, and Penitents, says S. Dionysius, are allowed to hear the holy modulation of Psalms, and the Divine recitation of sacred Scripture, but the Church invites them not to behold the sacred works and mysteries that follow.

J. M. Neale, Eastern Church, I. 208.

energy (en'ér-ji), *n.*; pl. *energies* (-jiz). [= D. G. *energie* = Dan. Sw. *energi*, *< F. énergie* = Sp. *energía* = Pg. It. *energia*, *< LL. energia*, *< Gr. ἐνέργεια*, action, operation, actuality, *< ἐνεργός*, active, effective, later form of *ἐνεργός*, at work, active, etc., *< ἐν, in, + ἐργον* = E. *work*.] 1. The actual exertion of power; power exerted; strength in action; vigorous operation.

The world was compact, and held together by its own bulk and energy. Bacon, Physical Fables, I., Expl.

There is no part of matter that does ever, by its sensible qualities, discover any power or energy, or give us ground to imagine that it could produce anything.

Hume, Human Understanding, I. § 7.

The last series of cognate terms are act, operation, *energy*. They are all mutually convertible, as all denoting the present exertion or exercise of a power, a faculty, or a habit.

Sir W. Hamilton, Metaphysics, vii.

We must exercise our own minds with concentrated and continuous energy.

Channing, Perfect Life, p. 19.

My desire, like all strongest hopes,

By its own energy fulfill'd itself.

Tennyson, Gardener's Daughter.

Something of indescribable barbaric magnificence, spiritualized into a grace of movement superior to the energy of the North and the extravagant fervor of the East.

Hosella, Venetian Life, II.

3. The exertion of or capacity for a particular kind of force; action or the power of acting in any manner; special ability or agency: used of the active faculties or modes of action regarded severally, and often in the plural: as, creative energy; the energies of mind and body.

Pope, *Imit. of Horace*, II. 1. 269.

7. In *physics*: (a) Half the sum of the masses of the particles of a system each multiplied by the square of its velocity; half the vis viva. See *vis viva*. This sense, introduced by Dr. Thomas Young, is now obsolete. It gave rise to the following, which was introduced about 1850 by Sir William Thomson, and is now widely current. (b) Half the greatest value to which the sum of the masses of all the particles of a given system each multiplied by the square of its velocity, could attain except for friction, viscosity, and other forces dependent on the velocities of the particles; otherwise, the amount of work (see *work*) which a given system could perform were it not for resistance dependent on the velocities. The law of *energy* is precisely the principle that these two definitions are equivalent. This law applies solely to forces dependent alone on the relative positions of particles—that is, to attractions, repulsions, and their resultants. It is shown mathematically that, taking any two level or equipotential surfaces (see *equipotential*) which a particle might traverse in its motion, the difference of the squares of its velocities as it passed through them would be the same no matter from what point of space it started, nor what might be the direction and velocity of its initial motion. Thus, the square of the velocity at any instant could be deduced from that at any other by simply adding or subtracting a quantity dependent merely on the positions at these instants. In like manner, if a number of particles were moving about, subject to mutual attractions and repulsions, it is shown in dynamics that if to the sum of the masses, each multiplied by the square of its velocity, be added a certain quantity dependent only on the positions of the particles at that instant, this last sum would remain constant throughout the motion. Of these quantities, half the mass of a particle into the square of its velocity is termed its *actual energy*, or *energy of motion*—that is, its *kinetic activity*; while the quantity to be added to the sum of the actual energy in order to obtain a constant sum is termed the *potential energy*—that is, the latent or slumbering activity, or *energy of position*; the constant sum being termed the *total energy*. The corresponding general principle of physics is that the total energy of the physical universe is constant; this is the principle of the *persistency or conservation of energy*. (See below.) Examples of actual energy are the energy of sensible motion as in a moving cannon-ball, of sound-waves, of heat; of potential energy, the energy of position of a weight raised above the earth, of elasticity as in a bent bow, of electricity, chemical combination, etc. Potential or positional energy and actual or kinetic energy are in incessant interconversion; for positional energy implies force, or a tendency to motion, as much as kinetic energy implies motion or change of position. Thus, in the case of a swinging pendulum, the actual energy is null at the turning-points at the extremities of the swing, while the potential energy is at its minimum when the center of gravity is lowest; and the oscillation, but for resistances (as friction), would continue forever. Another equivalent version of the law of energy is as follows: Suppose a system of bodies were moving under the influence of those positional forces to which the law exclusively applies, and suppose that at any one instant all the particles were to strike squarely against elastic surfaces so as to have the directions of their motions reversed, but their velocities otherwise unaltered; then the whole series of motions would be performed backward, so that the particles would again pass through the same positions they had already passed through, and in the same intervals of time, but in the reverse order. Thus, a squarely rebounding cannon-ball would move backward over the same trajectory, and with the same velocities, as in its forward motion, plunging into the mouth of the cannon again with exactly the velocity with which it had issued.

When a cannon-ball is arrested by a target, some other form of energy, chiefly heat, is produced in its place; moreover, there is a definite numerical relation existing between the energy expended and the heat which is produced as its equivalent. (See *equivalent*.) A water-wheel is an arrangement for transforming the energy of water into some other form of mechanical energy, as for sawing wood or grinding corn; a steam-engine is used to transform the potential chemical energy of coal or wood and oxygen of the air into mechanical energy, as in a mill; and in a voltaic battery the potential energy of the zinc and acid is transformed into the energy of an electric current, and this in turn may be transformed into light and heat, or mechanical motion, or chemical separation (as in electroplating). It is found, however, that in every transformation, while no energy is absolutely lost, a considerable portion is lost as useful or available energy, being transformed into useless heat; further, it can be shown that the process which is continually going on is a change from a higher type of energy to a lower, as from heat at a high temperature to heat at a lower—that is, a *degradation or dissipation of energy*. If the change were to go on until all bodies were at the same temperature, then no work of any kind would be possible. The principal stores of energy on the earth, available for the purposes necessary to human life and comfort, are: (a) the energy of coal, wood, oil, and other combustibles; (b) of water in motion, or in an elevated position; (c) of air in motion, as the wind; (d) the muscular energy of animals. To these might be added the energy of direct solar radiation, the energy of the tides, and some others of less importance. The source of all these forms of energy, except that of the tides, is to be found in the radiant energy of the sun.—*Energy of recoil*, the capacity for work which a body has upon a recoil, as a gun when fired.—*Energy of rotation or translation*, the capacity of a body for doing work in virtue of its motion of rotation or translation. See *motion*.—*Extensive energy*, the number of different cooperating powers which enter into a mental state. The phrase is also applied to a kind of elasticity.—*Radiant energy*, that form of energy which is emitted by a hot body and which is propagated by undulations in the luminiferous ether at a rate of about 186,000 miles per second, as the energy sent out by a stove, by the electric arc-light, or by the sun. Every body sends out radiant energy, whatever its temperature, but as its temperature rises the amount increases, and to the sum of rays before emitted are added others of shorter and shorter wave-length. When the temperature of a solid body is raised to about 600° C. it begins to be luminous—that is, to radiate rays of red light—and as it grows hotter it emits rays corresponding to the successive colors of the spectrum. At 1500° C. it becomes white-hot—that is, radiates all the rays of the spectrum. That portion of radiant energy which is incapable of affecting the eye is generally spoken of as *radiant heat*, in distinction from *radiant light*. See *heat, light, spectrum*.—*The law of the conservation of energy or of force*, the law that, fundamentally speaking, there are no forces in nature to which the law of energy does not apply; the principle that the total energy of the universe is constant, no energy being created or destroyed in any of the processes of nature, every gain or loss in one form of energy corresponding precisely to a loss or gain in some other form or forms. (See *correlation of energies*.) This is the great fundamental principle of modern physics; it was perhaps first enunciated by K. F. Mohr in 1837, though several physicists were independently led to its discovery. Those uniformities of nature which present phenomena of irreversible actions—such as friction and other resistances, the conduction of heat and the phenomena of the second law of thermodynamics in general, chemical reactions, the growth and development of organic forms, etc.—cannot, according to this doctrine, result from the laws of force alone, but are to be accounted as statistical uniformities, due to vast numbers of fortuitously moving molecules.—*Syn.* 2. Activity, intensity, push, stir, zeal.

enervate (ē-nēr'vāt or en'ēr-vāt), *v. t.*; pret. and pp. *enervated*, ppr. *enervating*. [*L. enervatus*, pp. of *enervare*, deprive of nerves or sinews, weaken: see *nerve*.] 1.
